About This Guide

Purpose

This guide describes the General Ledger transactions processed by the Unisys e-@ction Banking Back-Office Processing product.

The information contained in this guide is also available as online help.

Scope

The guide describes the General Ledger module and the associated data entry screens. Examples of the screens are shown and instructions for use are given.

Audience

This guide is for personnel preparing information for data entry.

Prerequisites

The audience should understand banking terminology. Users of this guide should have read the *Starter's Guide* that provides instruction in the use of the system.

How To Use This Guide

This guide should be used as a reference tool when preparing information for data entry. Use the guide in conjunction with a copy of your *Guide to Setting Up* or *Guide to Setting Up the Retail System*, and the *Core Functions and Inquiries Guide* or *Core Retail Functions and Inquiries Guide*. Refer to the *Core On-Demand Reports Guide* for instructions on how to select and run reports.

About Urbis

The usage of the product name Urbis is due to be phased out as part of the Unisys re-branding exercise. The replacement will be the generic term "Banking Back-Office Processing" solution or "Banking Back-Office" for short. To provide continuity with existing product documentation, the name Urbis is used within this document, but is synonymous with Banking Back-Office Processing.

Organisation

This guide consists of three sections and one appendix.

Section 1. General Ledger Accounting Introduction

This section provides an introduction to the General Ledger module.

Section 2. General Ledger Screens

This section describes the screens associated with entering General Ledger transactions. Each of the associated screens is illustrated and a short description is given.

Section 3. Definition of Field Names

The field names on the General Ledger screens are all defined in this section.

Appendix A. General Ledger Calculations

This appendix provides the formulae used by the system for calculations associated with the General Ledger.

Related Product Information

Guides Common to all Users of the System

Product Overview (3937 0234)

This document describes the capabilities and benefits of the modules of the Banking Back-Office Processing system. It consists of an overview of the system, and a description of each of the modules and interfaces available. It is intended for use by senior management.

Core On-Demand Reports (3937 0853)

This guide describes how to run online reports that are provided in the core of the system and which will be relevant to most implementations of the system. Any options available when producing a report are detailed as well as any specific calculations.

Overnight Reports (3937 0861)

This guide describes how to run offline reports. This includes an overview of overnight processing. Instructions on how to initiate reports are given. This guide should be used by all personnel who need to understand the reports and the overnight process.

Data Dictionary (3937 0226)

This document provides details of data fields within every dataset on your banking systems database. This document should be used by staff preparing the accounting models and writing SQL reports to inquire on the database.

Guides for Users of the Wholesale System Only

Operations Reference Card (3937 0986)

This document is a single card that provides a list of screen names and their mnemonics. The list is organised according to the menu structure of the Graphical User Interface. The card also describes how to log on and off the system, enter data, make inquiries and print reports. These instructions are relevant to the Graphical User Interface only.

Starter's Guide (3937 0531)

This guide describes how to enter data and make online inquiries. It also includes a description and example of commonly used data entry and inquiry screens. This guide is intended for all new and inexperienced personnel who need to enter data and make inquiries.

Guide to Setting Up (3937 0945)

This guide describes how to set up parameters that govern the operating environment of the system. It describes the procedures for setting up the business and operational tables, and setting up usercodes and access security. The procedures for setting up blueprint parameters are provided with a description of each parameter. It should be used by all persons involved in installation, implementation and maintenance of these system parameters.

Core Functions and Inquiries Guide (3937 0952)

This guide describes the kernel functions that are used regularly for the maintenance of information utilised by a number of modules. It describes the procedures for setting up and maintaining data, such as market rates and dealers. It also describes inquiries that are common to all contracts. This guide is relevant to all users.

Clients and Accounts Administration Guide (3937 0960)

This guide describes the data entry and inquiry screens associated with setting up and maintaining client details. This guide also describes the set up and maintenance of client accounts, including automatic payments (standing orders). An appendix covers the calculations used by client accounts. This should be used by personnel preparing information for data entry.

Corporate Trust Service Guide (3937 ####)

This guide describes the functionalities and processes of issuer related services in the capital market. This includes servicing and maintaining records for debt and equity or non-debt securities issued by a corporation. It details the services provided for managing various events such as issuance, maintain markups/positions, transfer or redemption of securities, coupon payments, serving options and so on. This guide is intended for personnel managing the corporate trust and agency service department.

Settlements Guide (3937 0366)

This guide describes the processes associated with settlements and customer transfers. It details how to administer the settlement queues. This guide also describes how to use the Straight Through Processing and Netting functions. It should be used by personnel managing the settlements department.

Risk Management Administration Guide (3937 0358)

This guide describes the data entry screens associated with setting up limits and exposures. The guide also describes the screens associated with portfolios. The amounts that represent book and market values are listed by module in an appendix. This guide is intended for personnel preparing information for data entry and those concerned with controlling risk.

Commercial Loans Administration Guide (3937 0150)

This guide describes the data entry screens associated with Commercial Loan transactions. This includes entry of commitments, various types of drawdown and contract schedules. An appendix gives the calculations used in the processing of Commercial Loan transactions. This guide is intended for personnel preparing information for data entry.

Foreign Exchange and Money Market Administration Guide (3937 0135)

This guide describes the data entry screens associated with Foreign Exchange and Money Market transactions. An appendix gives the calculations used in the processing of Foreign Exchange and Money Market transactions. This guide is intended for personnel preparing information for data entry.

Forward Rate Agreements and Interest Rate Swaps Administration Guide (3937 0168)

This guide describes the data entry screens and some related inquiries associated with Forward Rate Agreement and Interest Rate Swaps transactions. An appendix gives the calculations used in the processing of Forward Rate Agreement and Interest Rate Swap transactions. This guide is intended for personnel preparing information for data entry.

Futures Administration Guide (3937 0176)

This guide describes the data entry screens associated with Futures transactions and some related inquiries. An appendix gives the calculations used in the processing of Futures transactions. This guide is intended for personnel preparing information for data entry.

Traded Options Administration Guide (3937 0184)

This guide describes the data entry screens associated with Exchange-Traded Options transactions. An appendix gives the calculations used in the processing of Options transactions. This guide is intended for personnel preparing information for data entry.

OTC Options Administration Guide (3937 1034)

This guide describes the data entry screens associated with OTC Options transactions. An appendix gives the calculations used in the processing of OTC Options transactions. This guide is intended for personnel preparing information for data entry.

Securities Administration Guide (3937 0341)

This guide describes the data entry screens associated with Interest Bearing Securities, Discounted Securities and Repurchase Agreements transactions and some related inquiries. An appendix gives the calculations used in the processing of Securities transactions. This guide is intended for personnel preparing information for data entry.

Trade Finance Administration Guide (3937 0119)

This guide describes the data entry screens used by the Trade Finance department. This guide is intended for personnel preparing information for data entry.

Generalised Fees Administration Guide (3937 0374)

This guide describes the data entry screens associated with Fee transactions and supporting business table. This guide is intended for personnel preparing information for data entry.

On-Demand Reports Guide (3937 0937)

This guide describes on-demand reports in alphabetical order. Any options available when producing a report are detailed as well as any specific calculations. Note: core reports are described in the Core On-Demand Reports Guide; retail reports are described in the Retail On-Demand Reports Guide.

Guide to Interfaces with External Systems (3937 0911)

This guide describes the running of all the interfaces between your Banking Back-Office system and external systems. This guide is intended for personnel involved in setting up and running external interfaces.

Order Transport Management System (3937 1018)

This guide describes how to enter stock exchange securities contracts using the Order Transport and Management System. The screens in this guide allow users to add, maintain and inquire on deals, convert deals into stock exchange securities contracts, and liaise with brokers to complete settlement of a deal. This guide is intended for personnel preparing information for data entry.

Portfolio Management (3937 1026)

This guide describes how to create portfolios for the clients and agents who will be trading stock exchange securities with your institution. A large array of inquiry screens for managing these portfolios is also described. This guide is intended for personnel preparing information for data entry.

Stock Exchange and Securities Management (3937 1000)

This guide describes how to set up and maintain the securities master file, allowing you to record details of stock exchange securities. This guide also describes how to create, maintain and inquire on contracts based on stock exchange securities, including the necessary static data.

Loan Administration System Guide (3937 0994)

This guide describes the data entry screens associated with Syndicated Loans. It includes entry of facilities, and contracts such as drawdowns, guarantees and acceptances and their schedules. The screens in this guide allow users to enter data using workflows. This guide is intended for personnel preparing information for data entry.

Static Database Transaction Input Guide (3937 0093)

This guide, in conjunction with the static database, enables users to evaluate the functions and features of many of the modules. It should be used by persons who are familiarising themselves with the systems functionality.

Guides for Users of the Retail System Only

Retail Operations Reference Card (3937 0929)

This document is a single card that provides a list of screen names and their mnemonics. The list is organised according to the menu structure of the Graphical User Interface. The card also describes how to log on and off, enter data, make inquiries and print reports.

Starter's Guide to Retail (3937 0903)

This guide describes how to enter data and make online inquiries. It includes a description and example of commonly used data entry and inquiry screens. It also describes how to add a client and use a workflow with examples. This guide is intended for all new and inexperienced personnel who need to enter data and make inquiries.

Core Retail Functions and Inquiries Guide (3937 0887)

This guide describes the kernel functions that are used regularly for the maintenance of information utilised by a number of modules. It describes the procedures for setting up and maintaining data, such as exchange rates. It should be used by all users.

Guide to Setting Up the Retail System (3937 0879)

This guide describes how to set up parameters that govern the operating environment of the system. It describes the procedures for setting up the business and operational tables, blueprint parameters, and setting up usercodes and access security. It should be used by all persons involved in installing, implementing and maintaining the system.

Retail Lending Administration Guide (3937 0390)

This guide is only relevant to the retail loans module. It describes how to set up and maintain retail loan product templates. It also details the screens needed to enter an application for a loan and administer any loan granted as a result of an application. The screens used to record details of collateral used to back a loan are also described. An appendix gives the calculations used by retail loans. This guide should be used by personnel involved in loan administration.

Retail Clients and Accounts Administration Guide (3937 0895)

This guide describes the data entry and inquiry screens associated with setting up and maintaining client details. This guide also describes the set up and maintenance of client accounts, client account templates and automatic payments, such as standing orders. An appendix covers the calculations used by client accounts. This should be used by personnel preparing information for data entry.

Arrears Management Administration Guide (3937 0978)

This guide describes the data entry screens associated with the Arrears Management functionality. This allows the user to recognise when an account is in arrears, create an arrears case, and manage the arrears case.

Financial Transactions Reference Guide (3937 0408)

This guide is only relevant to the retail payments module. It describes the screens used to capture data from a retail delivery system. Also covered are the back office batch entry screens and how to set up accounting centre accounts and suspense accounts. This guide should be used by personnel who need to identify the data items that are captured by financial transactions and for those preparing information for data entry.

Retail On-Demand Reports Guide (3937 0846)

This guide describes retail on-demand reports in alphabetical order. Any options available when producing a report are detailed as well as any specific calculations.

Section 1
General Ledger Accounting Introduction

The General Ledger

General ledger accounts are used to summarise the assets and liabilities of an institution.

The system maintains a full multi-currency general ledger with separate self-balancing ledgers in every currency used.

The general ledger can be updated automatically via the accounting models for users of the non-retail modules or via the product transaction table for retail module users.

Structure of the General Ledger

The general ledger is structured according to a four tier hierarchy that can be used to represent a multi-branch or multi-company environment. The following diagram shows the relationships between elements in the structure. Each element represents a level within your organisation.

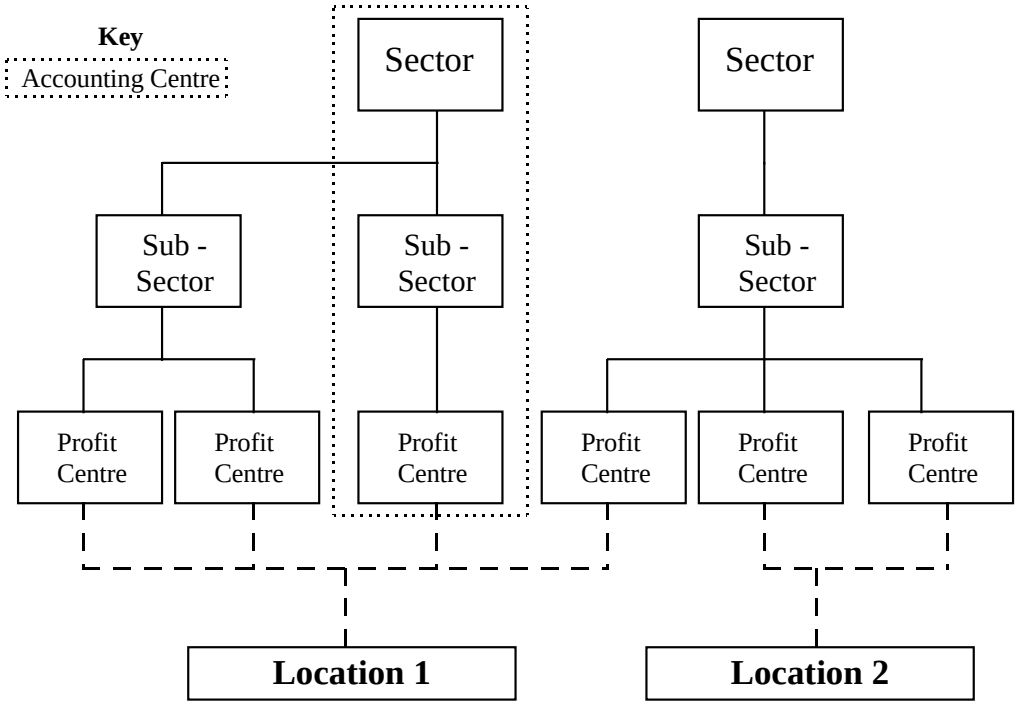

Figure 1–1. Structure of an Organisation

The structure of an organisation forms one operating unit. The basic operating unit is the accounting centre, comprising of a sector, sub-sector and profit centre. Each accounting centre is connected to one location, which can be any location. This means that sectors and sub-sectors can be related to various locations, however each profit centre is only related to one location.

Most activities in the system are undertaken at accounting centre level, and even though this also defines a location for the activity, the location is not seen. Every transaction is attributable to an accounting centre. Every user belongs to an accounting centre and all their transactions automatically contribute to it (this can be overridden at transaction level). In turn each accounting centre and each user also belong to a location and all their transactions automatically contribute to it.

Information on the activities in a system is drawn together to make reports and calculate total balances across your institution. These calculations involve the consolidation of figures either vertically through the system, via the accounting centre, or horizontally across the system via the location.

An example of how these four definitions can interact to define an institution:

- Sector - Could define the head office (eg in France)
- Sub Sector - Could define branches in different countries (eg in China, Japan, America and Germany)
- Profit Centre - Could define dealers in the branches.
- Location - Could define geographical regions for consolidation of information. (e.g. Europe, Asia, North America). However, dealers from the China branch, working in Britain could come under either the Europe or Asia location.

General Ledger Masters

General ledger masters are used to define the general ledger in two ways. First, each account is associated with a general ledger master, which provides a mechanism for grouping accounts. Secondly, general ledger masters define the accounts to which postings from the following are directed:

- Contracts
- Client account accruals
- Standing orders
- Direct Debits
- Client account interest payments
- Account charges
- Retail banking financial transactions

If a specified client or general ledger account is not available when account entries are posted through the accounting models, the postings are sent to the real or memo suspense account for the general ledger master associated with that contract or client. If the error suspense account for the general ledger master is also unavailable, the postings are sent to the system error suspense accounts set up on the System Parameters (SPMTR), described in the *Guide to Setting Up*. Users of the retail system should see Systems Parameters (SPMTR) in the *Guide to Setting Up the Retail System*.

A general ledger master must exist before a general ledger account can be created.

General ledger masters are created and maintained using the General Ledger Master (GLMAM) screen.

General Ledger Accounts

General ledger account details are entered and maintained using the General Ledger Account Definition (GLADM) and General Ledger Account Details (GLSTM) screens. Each account is related to a general ledger master, which must exist before the account can be created.

Account Type

The Account Type is entered for each general ledger account. You can create the following types of general ledger account:

- Real - these contribute to the balance sheet and must balance within currency and accounting centre.
- Memorandum - these accounts need not balance. They appear on the balance sheet or trial balance as footnotes, for example to represent dealing positions not yet taken into the real accounts (showing potential future profit or loss).

Account Definitions

General ledger account definitions are set up using the General Ledger Account Definition (GLADM) screen. From an account definition, an account or *series* of accounts can be created:

- By completing the General Ledger Account Details (GLSTM) screen. In this case, the general ledger accounts are opened immediately.
- By automatic generation if the “Automatic Account Generation” option is set on the General Ledger Account Definition (GLADM) screen. In this case, a general ledger account is opened when a posting is made to it via:
  - An accounting model
  - A retail transaction

From a general ledger account definition, accounts can be created for a single accounting centre or all accounting centres - this distinction is made on the General Ledger Account Details (GLSTM) screen. Similarly an account can be created for a single currency or all currencies - again this distinction is made on the General Ledger Account Details (GLSTM) screen.

Account Category

The Account Category specifies the type of postings that can be made to that account and is entered for each general ledger account. The following Account Categories are available:

1. Backing - only used for postings associated with non-retail banking client accounts. Postings cannot be made directly to Backing Accounts.
2. Control - only used for postings arising through the accounting models (for example, interest accrual on a contract).
3. Standard - used for postings arising either through the accounting models, directly through the posting screens or as the result of retail banking financial transactions.

Back-valued postings cannot be posted to categories 1 and 2 above.

Postings to General Ledger Accounts

Postings can be made to general ledger accounts in the following ways:

- Directly, as manually entered debits or credits
- Directly, using the CA Backing Account Change (CABAC) screen, described in the *Clients and Accounts Administration Guide*.
- Automatically through the accounting models as a result of:
  - Interest settlements
  - Contract related transactions
  - Accruals
- Manually, from external accounting entries using models set up on the External Accounting Models (EXACM) screen, described in the *Guide to Setting Up*.
- Automatically as backing postings or contra-postings
- Automatically loaded from an outside source as cash wastes
- Automatically via the Product Transaction Types (PTTRM) screen as the result of retail banking financial transactions, described in the *Retail Clients and Accounts Administration Guide*.

***Note**: The volume of retail banking financial transactions makes it inappropriate to make individual postings to the general ledger online. Therefore the information for each general ledger account is batched together during the day and a single posting for each general ledger account is made during the end-of-day processing by the PTTOTUPD - Post Product Total to General Ledger report (see the* Overnight Reports Guide *for further details).*

The system enables you to process forward valued postings for general ledger accounts. The ability to process back-valued postings is controlled by blueprint parameters defined at installation.

All forward and back-valued postings are reflected in the general ledger account book balance on input. The value balance for the general ledger account is updated on the posting value date during the start-of-day process.

***Note:** When opening a client account, you can choose whether transactions posted to it are reflected in the General Ledger online or offline. Online updates are recommended for client accounts to be used for low-volume banking functions. Offline updates are recommended for client accounts to be used for retail banking functions.*

Postings entered manually can be entered in batches or as cash wastes/bulk adjustments. The following types of direct postings can be entered in batches:

- Debit - to debit a general ledger account
- Credit - to credit a general ledger account

Each batch must contain postings made by the same user and must be from the same accounting centre. The accounts must all be in the same currency. Batches must balance within value date before they can be closed. Back-valued postings must also balance within posting date.

Both single and multiple currency direct postings can be entered as cash wastes or bulk adjustments.

Bulk Loading of Cash Wastes

The system has the capability of uploading bulk postings created in another system into its database. To do this, you must run the report LDBLKPOST - Load Bulk Postings, this will access and read the file containing the postings. The postings will then be converted into the system format, and entered into the system database as cash wastes. The report output contains details of the postings converted, and any postings that could not be converted.

The LDBLKPOST - Load Bulk Postings report is described in the *On-Demand Reports Guide*.

Back-Valued Postings

You can choose whether or not you wish to be able to back-value postings. This feature is controlled by blueprint parameters.

Back-valued postings update the book balance of the general ledger account from the posting date (entered with the posting) to the current balance. They also update the value balance from the value date of the posting to the current processing date.

You can set up, and amend at any time, a balance sheet rule-off date to control back-valued postings. Postings can only be back-valued up to and including the balance sheet rule-off date currently in use. This date is established on the Balance Sheet Rule Off Dates (GLROM) screen. For further information on, and an example of this screen, refer to Section 2 “General Ledger Screens”.

Back-valued postings are referred to as “book adjustment postings”. They are entered on the following general ledger book adjustment posting screens:

- GL Book Adjustment Batch Header (GLABH)
- GL Book Adjustment Credit (GLACR)
- GL Book Adjustment Debit (GLADR)
- GL Book Adjustment Batch Close (GLABC)
- GL Bulk Adjustments (GLADJ)

Batched postings must balance within value date, posting date, currency and accounting centre.

When reopening a batch the batch number entered must have been entered originally through the GL Book Adjustment Batch Header (GLABH) and not through the standard Batch Header (BHEAD) screen (see “Entering Batched Postings”).

***Note**: If the batch was entered via the GL Bulk Adjustments (GLADJ) screen, then it must be reopened using that screen. The batch cannot be reopened using the GL Book Adjustments Batch Header (GLADH) screen.*

For further details of how to enter back-valued postings see “Entering General Ledger Book Adjustment Postings”.

Forward Valued Postings

Forward valued postings are only reflected in the general ledger account book balance on input. The value balance of the general ledger account is updated on the value date during the start-of-day process.

Postings with a value date of today or later can only be posted to standard accounts.

Batched postings must balance within value date. Note that the number of days forward that a posting can be valued is defined at installation using blueprint parameter BP-FWD-VAL-DAYS, described in the *Guide to Setting Up*. Users of the retail system should see BP-FWD-VAL-DAYS in the *Guide to Setting Up the Retail System*.

For details of how to enter forward valued postings see “General Ledger Screens”.

Average Balance

The following information is maintained to enable average balance information (based on the book balance at the end of the day) to be reported and used for statistical purposes:

- Days Credit - This is the total number of days during a period where a credit balance exists on an account at the close of business. A balance of zero is counted as a credit balance for this purpose.
- Days Debit - This is the total number of days during the period where a debit balance exists on an account at the close of business.
- Average Credit Balance - At any date during a profit period the average credit balance is calculated by summing the close of business balance for each day the account has been in credit during the period thus far and dividing this total by the current “Days Credit” value.
- Average Debit Balance - The average debit balance is calculated by summing the close of business balance for each day the account has been in debit during the period thus far and dividing this total by the current “Days Debit” value.

Histories

History records, for example turnover, balance and average balance, are created when an account changes and at the end of each period. These are used to record period statistics, for example to compare one year's turnover with that of another year, or to control back-valuations. All historical records are retained for a number of days specified at installation. See Blueprints for Record Retention in the *Guide to Setting Up*. Users of the retail system should see Retail Blueprints for Record Retention in the *Guide to Setting Up the Retail System*.

***Note**: Client account records are usually retained for a shorter period than general ledger accounts.*

Statistics

The following statistics are maintained for each account:

- Account balances
- Debit and credit of average balance for period-to-date
- Debit and credit days turnover
- Number of days in debit or credit period-to-date
- Net average balance year-to-date

Cross Accounting Centre Postings

If a transaction performed at one accounting centre is actioned against an account held at another accounting centre, then cross accounting centre postings are required to balance the general ledger at each accounting centre.

The general ledger accounts to be used for the credits and debits between specified accounting centres can be defined using the Cross Accounting Centre Rules (ACRLM) screen, described in the *Guide to Setting Up*.

Cross accounting centre postings for general ledger accounts can be entered manually in batches using the GL Bulk Adjustments (GLADJ) screen.

See Retail Cross Accounting Centre Postings later in this section for a description of how cross accounting centre postings affect users of a retail system.

General Ledger Updates for Retail Banking Transactions

Retail banking general ledger account transactions do not post via the accounting models. The postings that are made depend on rules specified for a product on the Product Transaction Types (PTTRM) screen. Two accounts are specified for every transaction that is permitted for a product: one for the product itself and one for the transaction.

The Product Transaction Types (PTTRM) screen can pick up defaults for both general ledger accounts. The default general ledger account for a transaction code is defined on the Retail Transaction Definition (TRDFM) screen. The default for a product is defined with the product details on the Product Maintenance Screen 1 (PTA1M) for retail banking client accounts and on the Loan Product Maintenance - 2 (PTL2M) screen for retail loan accounts. The Product Maintenance screens are described in the *Retail Clients and Accounts Administration Guide,* the Retail Transaction Definition (TRDFM) screen is described in the *Financial Transactions Reference Guide* and the Loan Product Maintenance -2 (PTL2M) screen is described in the *Retail Lending Administration Guide*.

The provision of two general ledger accounts for every combination of product and transaction enables you to group activity by product and by transaction. Therefore, on the transaction side you could group all proceeds from one type of transaction together (for example, deposits) or you could subdivide them into any size of group down to a single transaction code and product combination (for example, interest settlement on a savings account could update a different general ledger account to interest settlement on a current account).

When a transaction occurs that causes the balance of a client account to be updated, there must be corresponding updates to the general ledger for the product. This occurs in the form of two postings: a debit and a credit. One posting is to the general ledger account for the product and the other to the general ledger account for the transaction (the transaction type determines which account receives the credit and which receives the debit).

For example, the system generates three postings for a cash deposit of £100 to a current account:

- Client’s account is credited with £100
- Product general ledger account that represents the current account product is credited with £100
- Transaction general ledger account that represents the cash till is debited with £100

The following cases are handled slightly differently to the scenario outlined above:

- Transactions that involve nostro accounts
- Cross currency transactions
- Credit interest accrual and settlement
- Debit interest accrual and settlement
- Deferred charges accrual and settlement
- Loan account interest accrual and settlement
- Loan account interest accrual and settlement on non-performing loans

The above cases are explained below.

Nostro Accounts

In this case, there are three postings as usual: one to the client account that is the object of the transaction, one to the product general ledger account and one to the transaction general ledger account. The difference is that the transaction general ledger account cannot be determined until the currency and nostro number used by a transaction are known; these are included as part of the transaction details. The system can then access the nostro record indicated to determine the general ledger account and nostro to be updated.

Cross Currency Transactions

As it is important to retain control of the foreign currency exposure of a financial institution, an 'Other Currencies Control Account' is held by the system in all currencies for each accounting centre. This enables the system to balance a multi-currency general ledger. This Other Currencies Control Account is specified as system wide parameter (see the description of the System Parameters (SPMTR) screen in the *Guide to Setting Up the Retail System*) and can be picked up by the system as the default transaction general ledger account when indicated for cross currency transactions.

An example of a cross currency transaction is given below:

Client Account A is a GBP account, transferring 100 GBP to Client Account B, which is a USD account. Assume that the exchange rate is 1 GBP to 1.5 USD.

The postings created for the above transaction are:

- Client Account A is debited with 100 GBP
- Client Account B is credited with 150 USD
- Product general ledger account that represents Client Account A's product is debited with 100 GBP
- Currency Control Account is credited with 100 GBP
- Product general ledger account that represents Client Account B's product is debited with 150 USD
- Currency Control Account is debited with 150 USD

Credit Interest Accrual and Settlement

Credit interest is accrued in a separate product general ledger account where it remains until settlement. The balance of this account represents a liability and can be grouped by product or type of product. The transaction general ledger account represents the account in which such expenses are accumulated.

When interest is settled, three postings are made: a credit to the client account that receives the interest, a debit from the product general ledger account where interest has accrued and a credit to the product general ledger account that represents the product balances.

Debit Interest Accrual and Settlement

Debit interest is accrued in a separate product general ledger account where it remains until settlement. The balance of this account represents an asset. The transaction general ledger account represents the account that receives such income.

When interest is settled, three postings are made: a debit to the client account that pays the interest, a debit from the product general ledger account and a credit to the transaction general ledger account in which the interest for the product has accrued.

Deferred Charges Accrual and Settlement

Deferred charges are accrued in a product general ledger account where they remain until settlement. The balance of this account represents an asset. The transaction general ledger account represents the account that receives income from charges.

When a deferred charge is settled, three postings are made: a debit to the client account that pays the charge, a debit from the product general ledger account where charge has been deferred and a credit to the transaction general ledger account in which income accumulates.

Loan Account Interest Accrual and Settlement

Interest accrual on a loan is represented by three transactions:

- Loan interest accrual (transaction code 850)
- Loan interest arrears interest accrual (transaction code 851)
- Loan principal arrears interest accrual (transaction code 852)

This gives you the opportunity to accrue the different types of interest in different product general ledger accounts so that they can be recorded as separate assets. At the same time, you use one transaction general ledger account to record income for the product.

When interest is settled, the product general ledger account(s) where interest accrued is credited, the transaction general ledger account in which income accumulates is credited and the loan account itself is debited.

Loan Account Interest Accrual and Settlement on Non-Performing Loans

The same principal applies to interest on non-performing loans as to interest on performing loans in that the three types of interest can be accrued in separate general ledger accounts, the difference is that the general ledger account(s) are normally memo suspense general ledger accounts. This means that arrears accrual balances for non-performing loans are not reflected as income in your profit and loss statement and are not included as assets on your balance sheet.

Event Charges

Event charges are attached to events rather than financial transactions, for example providing a replacement statement. Event charge transactions are treated in the same way as ordinary withdrawal transactions. When an event charge is applied, the system makes three postings: the client's account is debited, the product general ledger account for the client account is debited and the transaction general ledger account is credited. You could define a series of charge transaction general ledger accounts to separate different types of charge within the income area of the general ledger.

Retail Cross Accounting Centre Postings

If a transaction performed at one accounting centre is actioned against a real account held at another accounting centre, then cross accounting centre postings are required to balance the general ledger at each accounting centre.

For example, the following postings are required for a cash deposit of £100 made at one accounting centre for a current account held at another accounting centre:

- Client's account is credited with £100
- Product general ledger account that represents the current account product is credited with £100 at the accounting centre of the current account
- Transaction general ledger account that represents the cash till is debited with £100 at the accounting centre where the transaction took place

To enable the general ledger of each accounting centre to balance, the following additional postings are generated by the system:

- At the accounting centre holding the client's account, the general ledger account that represents cross accounting centre debits is debited with £100
- At the accounting centre at which the transaction took place, the general ledger account that represents cross accounting centre credits is credited with £100

The general ledger accounts to be used for the credits and debits between specified accounting centres can be defined using the Cross Accounting Centre Rules (ACRLM) screen, described in the *Guide to Setting Up the Retail System*.

Process for Updating the General Ledger for Retail Accounts

The following figure shows the process used in updating the general ledger when a posting to a retail client account is received. The datasets shown are described in the '*Data Dictionary*'.

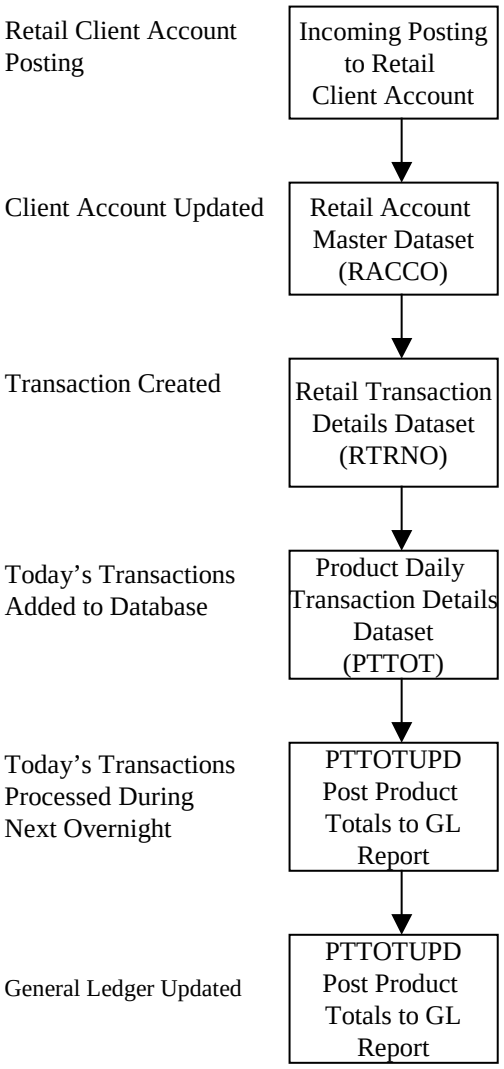

Figure 1–2. Updating the General Ledger for Retail Accounts

Statutory Reporting

The system provides an interface to rFRAME, the statutory reporting package from CMG. Information is extracted from the system and placed in flat files. These flat files are fed through to the rFRAME software that produces and sends the statutory reports. At present only Capital Adequacy Reports for the Bank of England are supported.

The extraction process is carried out at regular intervals, depending on the requirements of the central bank this might be daily or monthly. The timing of the reports can be changed by altering the list of overnight reports that is to run each day. Extraction is undertaken by the STRXTRACT - rFRAME Interface Extract Report, which runs during phase C of the overnight. This report, and the overnight process in general are described fully in the *Overnight Reports Guide*.

Information is extracted from the system database grouped into 10 records groups:

- Record type 0 - Exchange Rate
- Record type 1 - Current Accounts
- Record type 2 - Deposit and Loan Accounts
- Record type 3 - Internal Accounts
- Record type 4 - Profit and Loss
- Record type 5 - Bills
- Record type 6 - Investments
- Record type 8 - Facilities and Commitments
- Record type 9 - Foreign Exchange and Interest Rate Contracts
- Record type 10 - Contingent Liability

All internal accounts (general ledger) which are required to be reported on must be defined on the General Ledger Statutory Information (GLSRM) screen, detailed in Section 2, General Ledger Screens.

There are two methods of reporting accrued amounts using the rFRAME interface, cumulative and non-cumulative. These are controlled by the blueprint parameter BP-STRCUMOPT. This parameter can be either:

- "N"- Non Cumulative. Amounts reported by the interface are those accumulated during the last reporting period only.
- "Y" - Cumulative. Amounts reported by the interface are cumulative, that is the value sent is the total of accrued amounts in all reporting periods.

The following points should be followed when preparing statutory reporting:

- For the correct reporting of period to date information on interest accruals, it is necessary that the profit periods are aligned to the periods at which statutory returns will be submitted. Profit periods are set up on the Profit Period Dates Maintenance (PPDAT) screen, described in the *Guide to Setting Up*.
- System data should be retained for a sufficient period to allow correct reporting of period income and expenses for deleted or matured contracts or accounts.

The following definitions are used by the rFRAME interface when preparing reports:

- **Accrual Amount** is interpreted as the interest amount accrued to date since the last reporting period minus the part of this interest that has been paid or received up to the reporting date (i.e. the accrued interest outstanding).
- **Interest Payable / Receivable** is interpreted as the interest amount accrued to date since the last reporting period regardless of how much of it has since been paid or received. Where the Cumulative Reporting Option is chosen, this amount will be the cumulative figure covering the current and all past profit periods in the current financial year.

Euro Related Information

Economic and Monetary Union (EMU) is a process by which certain countries in the European Union are converting their national currencies (also called “in” currencies) into a single European currency called the Euro.

The system supports this conversion process fully for all currencies and all phases of the conversion (see "Euro Related Information" in the *Core Functions and Inquiries Guide* for more information).

Section 2
General Ledger Screens

Introduction

The following functions are available using the screens in the General Ledger Accounting module:

- **Setting up and maintaining general ledger masters, default masters and account details**
  - General Ledger Masters (GLMAM)
  - Default General Ledger Masters (GLDFM)
  - GL Account Definition Maintenance (GLADM)
  - GL Account Details (GLSTM)
  - GL Account Close (GLCLS)
- **Entering postings**
  - Batch Header (BHEAD)
  - General Ledger Credit (GLCR) and General Ledger Debit (GLDR)
  - Batch Close (BCLOS)
  - Cash Wastes (CASHW)
- **Authorising Batches (if required)**
  - Batch Inquiry (BTCHI)
  - Batch Authorisation (CABAA)
- **Entering book adjustment postings to general ledger accounts**
  - GL Book Adjustment Batch Header (GLABH)
  - GL Book Adjustment Credit (GLACR) and GL Book Adjustment Debit (GLADR)
  - GL Book Adjustment Batch Close (GLABC)
  - GL Bulk Adjustments (GLADJ)
- **Making automatic payments via standing orders**
  - Standing Order Static Details (SOSTM)
- **Controlling Income Statements and Balance Sheets**
  - Trial Balance and Balance Sheet (TBBSM)
  - Balance Sheet Rule-off Date (GLROM)
- **Statutory Reports**
  - GL Statutory Report Information Maintenance (GLSRM)

- **Inquiries related to general ledger accounts**
  - GL Master Contract Type Inquiry (GLMAI)
  - Default GL Masters Inquiry (GLDFI)
  - GL Account Definition Inquiry (GLADI)
  - GL Accounts Inquiry (GLSTI)
  - GL Account Summary (GLASI)
  - GL Account Details Inquiry (GLACI)
  - Account History Inquiry (HISTA)
  - Standing Orders Master Details Inquiry (SOSTI)
  - Postings Inquiry by Account (POSTI)
  - Postings Inquiry by Number (POSTN)
  - Statement Inquiry by Date (STMTD)
  - Journal Inquiry by Value Date (JRNLI)
  - Trial Balance/Balance Sheet Inquiry (TBBSI)

The following general ledger inquiries are available to users of the Loans Administration module

- LA Postings Inquiry by Account (LPSTI)
- LA Postings Inquiry by Number (LPSTN)
- LA Journal Inquiry by Value Date (LJRNI)

For each screen the following is provided:

- A description of its use
- An example of the screen

A full description of the fields on the screens, and valid entries, is given in Section 3, “Definition of Field Names”.

See the *Starter’s Guide* for a description of how to access and use screens.

General Ledger Master (GLMAM)

Before you create general ledger accounts, you must create the general ledger masters. The general ledger masters define the ledger categories of contracts and accounts.

Each master is referenced by a six-digit number and has a shortname and longname used for inquiries and reports. You may use the same name for more than one master.

When you set up the general ledger master table, you must first decide on the structure of the general ledger by contract types. Any general ledger account which backs a client account must relate to a general ledger master which has a contract type matching the contract type code for client accounting (CAAC). Contract types are defined on the General Purpose Narratives (GNARR) table, type “CN”, and are not relevant to users of a retail system.

Note: *Check your general ledger master settings carefully during system installation.*

Up to 30 related accounts can be defined for each general ledger master. These are used in the definition of system generated entries.

If a specified account is not available when client or general ledger account entries are posted through the accounting models, the postings are sent to the real or memo error suspense account for the appropriate general ledger master. If the error suspense account for the general ledger master is also unavailable, the postings are sent to the system error suspense accounts set up on the System Parameters (SPMTR) table.

You cannot directly delete a general ledger master on the General Ledger Master (GLMAM) screen. This action simply causes the general ledger master to become inactive until it is purged (after the retention period you have specified). Until it is purged, the master can be reinstated, by recalling it for change. The retention period is specified using the retention period parameter GLMAM, described in the *Guide to Setting Up*. Users of the retail system should see GLMAM in the *Guide to Setting Up the Retail System*.

The following figure shows an example of the General Ledger Master screen.

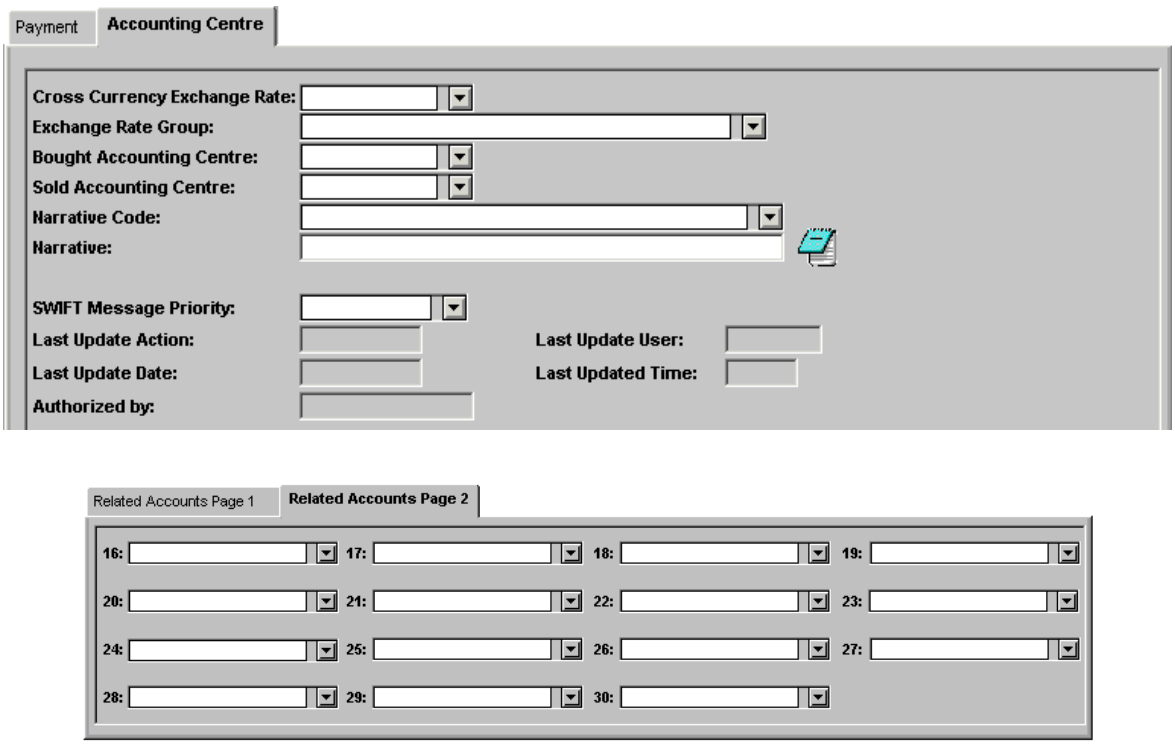

Figure 2–1. General Ledger Master screen

GL Master Contract Type Inquiry (GLMAI)

This inquiry gives a summary of the general ledger masters for the contract type selected, together with all other contract types associated with each general ledger master. You can use this inquiry to check the general ledger masters to which the specified contract type is linked.

An example of this inquiry screen is given in the following figure:

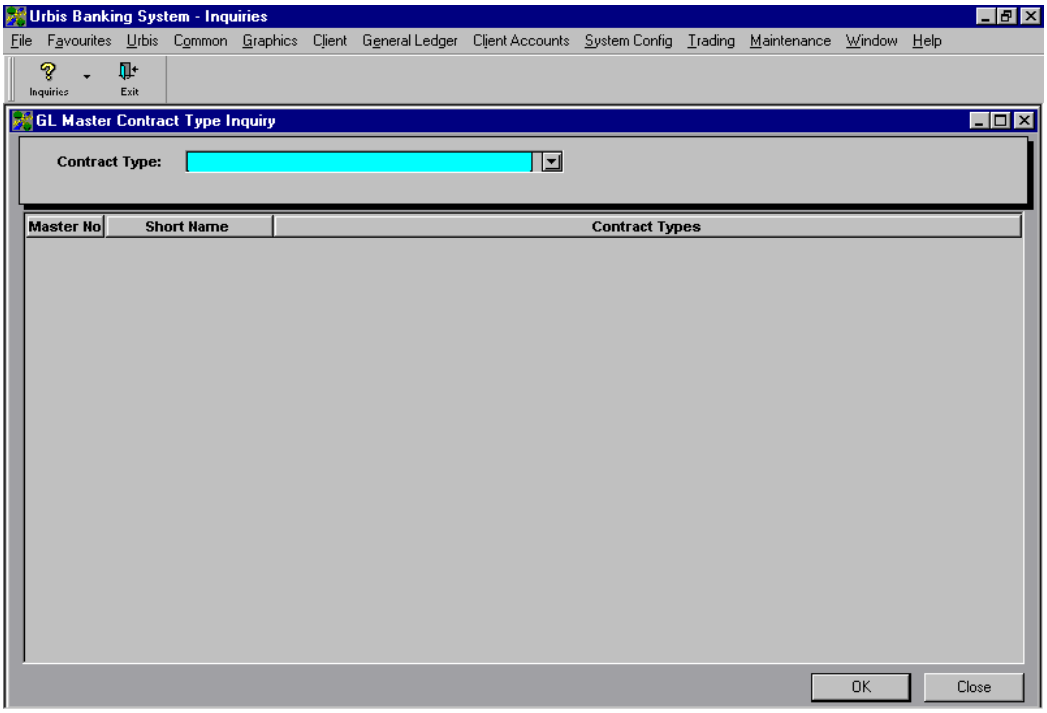

Figure 2–2. GL Master Contract Type Inquiry screen

Default General Ledger Masters (GLDFM)

For each accounting centre, contract type, product and internal client type combination you can specify a default general ledger master. The default is used if the general ledger master is not entered on a contract data entry screen. These defaults are entered on the Default GL Master Maintenance screen. On this screen you enter the following:

- The identifier of the accounting centre
- The contract type
- The product type (or instrument code for Futures, Traded Options, and OTC Options products)
- The internal client type
- Bought or Sold (only for FRA contract types)
- The default general ledger master number
- The trade type (only for Interest Rate Swaps, Forward Rate Agreements, Futures, Traded Options, OTC Options, and Securities).

When you are setting the same general master for a number of internal client types, you can speed up entry by using the 'Range of Types' field. This field is only applicable when you are adding entries, it cannot be used to change or delete a range of entries.

The following figure shows an example of the Default General Ledger Master Maintenance screen.

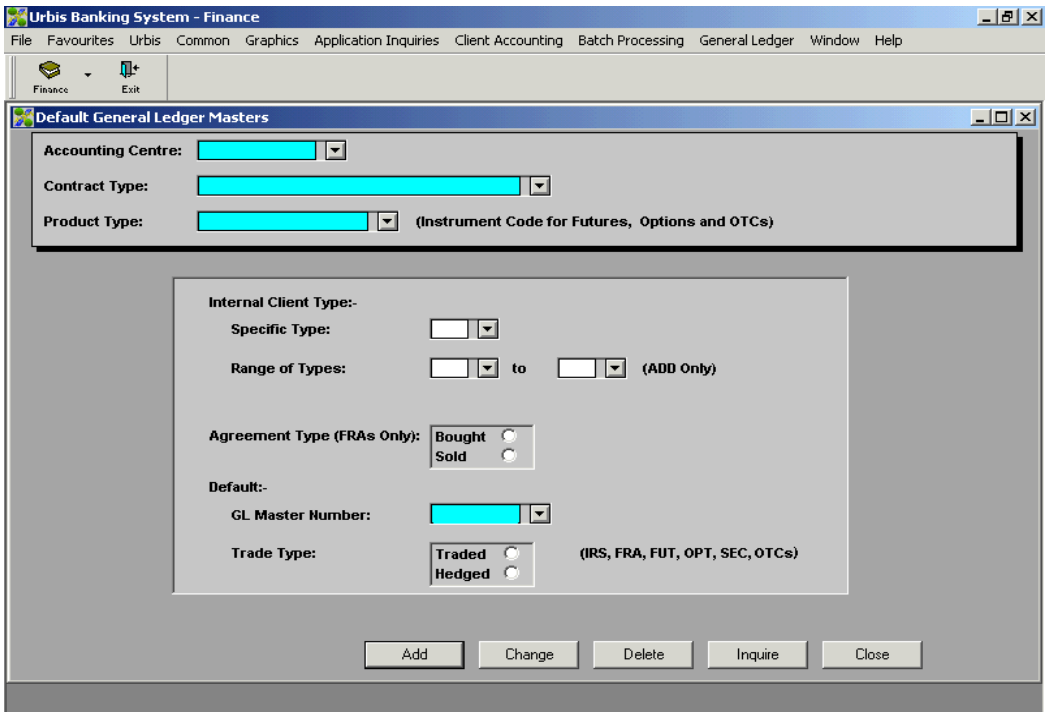

Figure 2–3. Default GL Master Maintenance screen

Default GL Masters Inquiry (GLDFI)

This inquiry displays for each “Contract Type”, the default general ledger master number for each combination of “Accounting Centre”, “Product Type” and “Client Type”.

For FRAs you may define two Contract types for a product type. The system also displays whether the default general ledger master number has been set up for a bought or sold contract type.

You may also indicate where in the list of Accounting Centres, product types and client types you wish the inquiry to begin.

An example of the inquiry screen is given in the following figure:

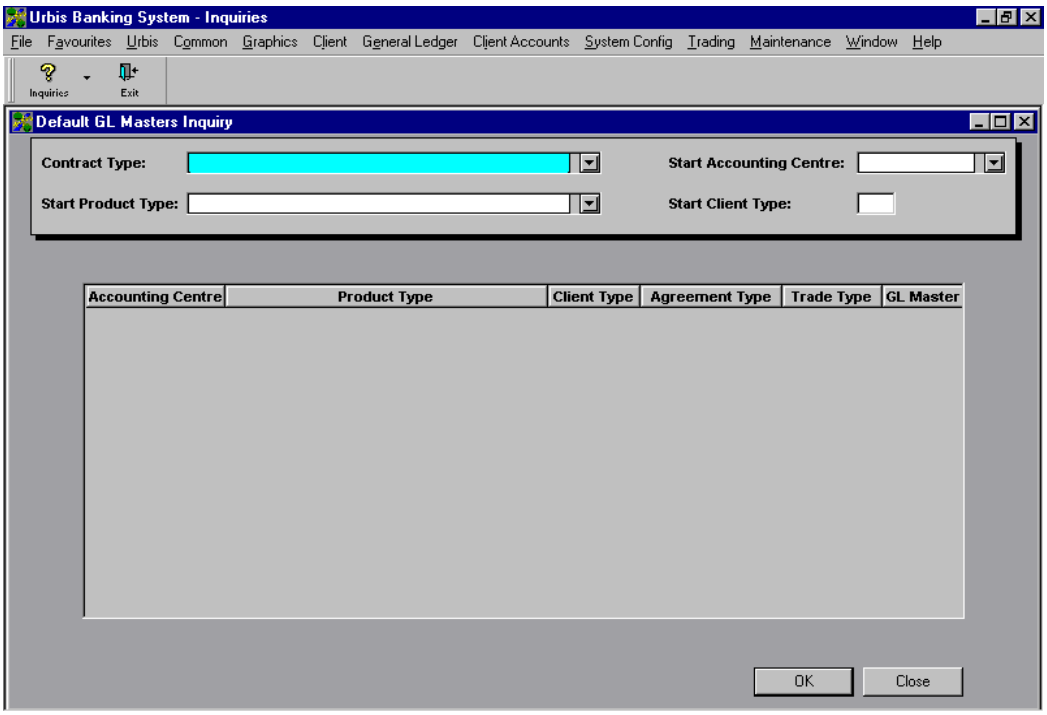

Figure 2–4. Default GL Masters Inquiry screen

Setting Up and Maintaining General Ledger Accounts

A general ledger account or a series of general ledger accounts can be set up via two methods:

- By completing the General Ledger Account Definition (GLADM) and General Ledger Account Details (GLSTM) screens. In this case, the general ledger accounts are opened immediately.
- By completing the GL Account Definition Maintenance (GLADM) screen and setting the "Automatic Account Generation" field to Yes on that screen. In this case, a general ledger account is opened when a posting is made to it via:
  - An accounting model
  - A retail transaction

Note: *In the case of retail postings, one general ledger account based on a particular general ledger account definition must be created by completing both the GL Account Definition Maintenance (GLADM) screen and the General Ledger Account Details (GLSTM) screen, before automatic generation of general ledger accounts will take place.*

A general ledger account is not generated automatically when a posting is made directly to it via the CA Backing Account Change (CABAC) screen or one of the batch posting screens, such as the Cash Wastes (CASHW) screen.

When you use the "Automatic Account Generation" field on the General Ledger Account Definition (GLADM) screen, you are effectively defining a series of general ledger accounts without actually filling the system with unwanted accounts.

A series of general ledger accounts can be produced immediately by setting the "All Accounting Centres" and/or "All Currencies" fields to Yes on the General Ledger Account Details (GLSTM) screen. For example, by setting "All Accounting Centres" to Yes, "Account Currency" to GBP and "All Currencies" to No, a general ledger account in British pounds will be produced for each accounting centre.

If general ledger accounts have been set up and a change is subsequently made to any details on the General Ledger Account Definition (GLADM) screen, you must run the report GLACDEFUPD to effect the change across all related general ledger accounts.

General ledger accounts are closed using the General Ledger Account Close (GLCLS) screen.

General Ledger Account Definition (GLADM)

This screen is used to set up and maintain the primary details of general ledger accounts. The following types of account can be created:

- Real
- Memorandum

General ledger accounts can be deleted using the General Ledger Account Definition (GLADM) screen, but for only those that do not have active accounts. An inquiry must be made on the general ledger account to be deleted before the deletion is carried out. The account is then purged, after the defined retention period. For details see "Retention Dates" in the *Guide to Setting Up* or "Retail Retention Dates" in the *Guide to Setting Up the Retail System*.

The following figure shows an example of the General Ledger Account Definition screen.

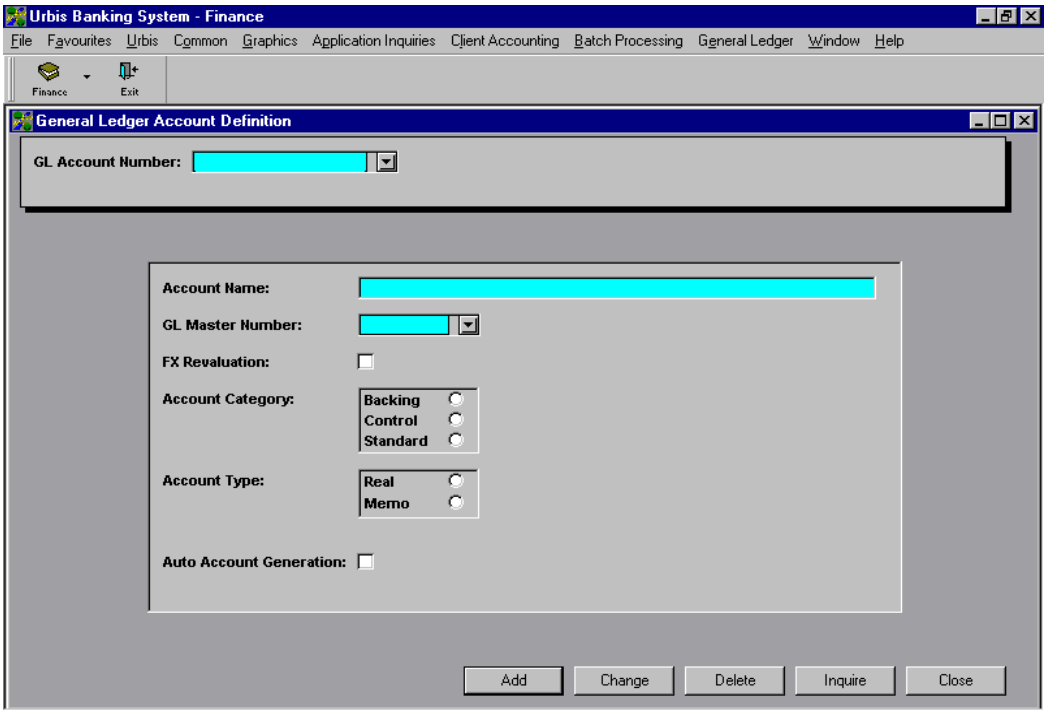

Figure 2–5. General Ledger Account Definition screen

General Ledger Account Details (GLSTM)

This screen is used in conjunction with the General Ledger Account Definition (GLADM) screen to set up a general ledger account or a series of general ledger accounts.

General ledger accounts can be created in all currencies by setting “All Currencies” to Yes and for all accounting centres by setting “All Accounting Centres” to Yes.

It is optional to enter an “Account Name” and “Status” on General Ledger Account Definition (GLADM), but if you do, the values can be overwritten by making an entry here.

General ledger accounts cannot be deleted on the General Ledger Account Details (GLSTM) screen. Instead, the GL Account Close (GLCLS) screen must be used. The general ledger account is then purged, after the defined retention period. The retention period is defined by the retention parameter GLSTO, defined on the Retention Table Maintenance (RETTM) screen, described in the *Guide to Setting Up*. Users of the retail system should see 'Retention Table Maintenance (RETTM)' in the *Guide to Setting Up the Retail System*.

The following figure shows an example of the General Ledger Account Details screen.

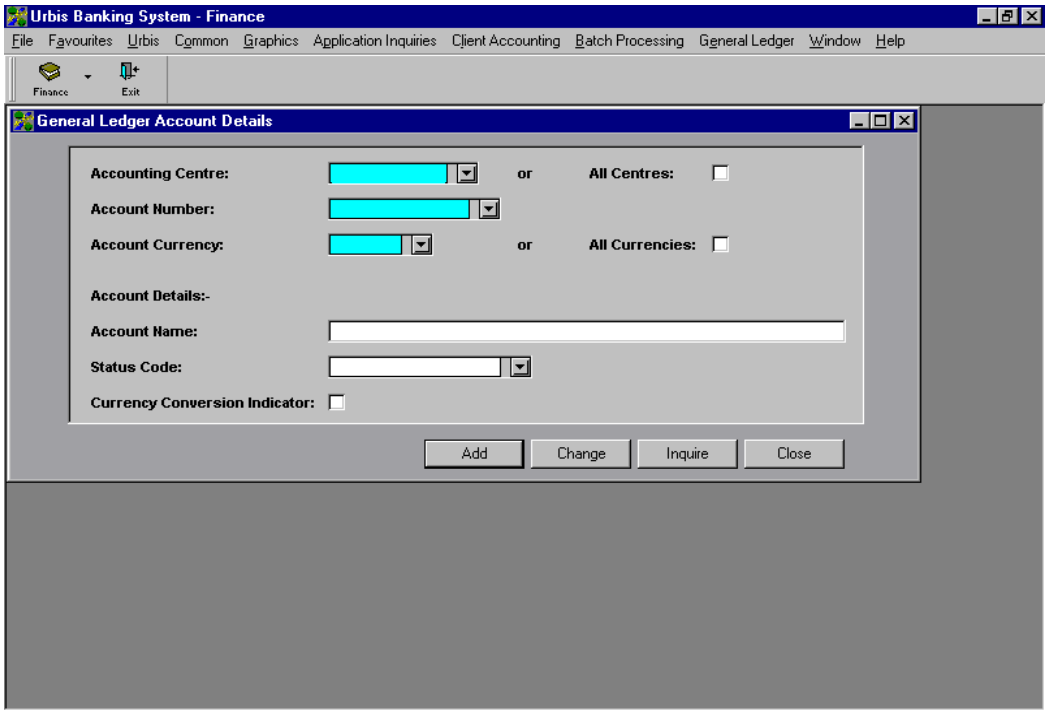

Figure 2–6. General Ledger Account Details screen

General Ledger Account Close (GLCLS)

This screen is used to close a general ledger account. When you have entered details of the account you are asked to confirm that you have selected the correct account for closure.

Closed general ledger accounts are retained by the system for the retention period specified by retention period parameter GLSTM before they are purged. You cannot re-use a general ledger account number until the account has been purged. The retention period is specified using the retention period parameter GLSTM, described in the *Guide to Setting Up*. Users of the retail system should see GLSTM in the *Guide to Setting Up the Retail System*.

Note: *Once a general ledger account has been closed, it cannot be reopened.*

The following figure shows an example of the General Ledger Account Close screen.

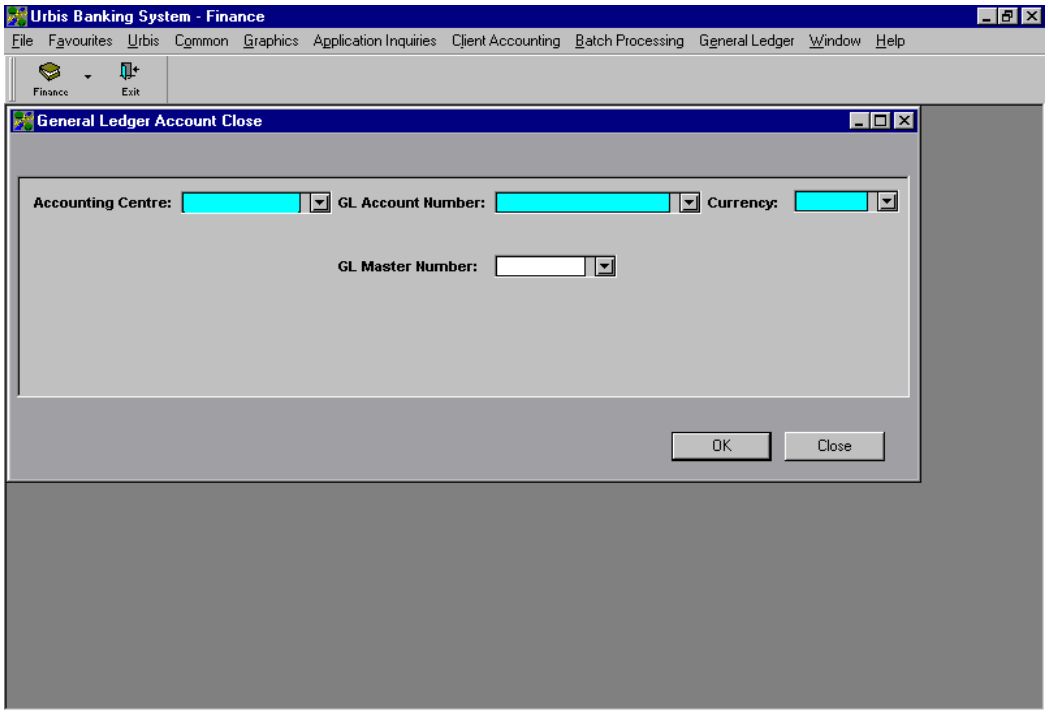

Figure 2–7. General Ledger Account Close screen

Making Inquiries on General Ledger Accounts

There are five screens available to provide details of the general ledger accounts and definitions available on the system:

- General Ledger Account Definition Inquiry (GLADI) screen provides a list of all the general ledger account definitions that have been entered using the General Ledger Account Definition (GLADM) screen
- General Ledger Accounts Inquiry (GLSTI) screen provides a list of all the general ledger accounts on the system
- General Ledger Account Summary (GLASI) screen provides a list of all the accounting centres that have a general ledger account with a specified account number and currency
- General Ledger Account Details Inquiry (GLACI) screen provides full details of an individual general ledger account
- Account History Inquiry (HISTA) screen provides details of the balance outstanding on a particular date

General Ledger Account Definition Inquiry (GLADI)

This screen allows you to make an inquiry on the general ledger account definitions entered the General Ledger Account Definition (GLADM) screen.

To recall a list of account numbers you should input a “Start Account Number” to indicate at which point in the list you wish the inquiry to begin.

From here you may link to a particular account’s record as set up on the General Ledger Account Definition Maintenance (GLADM) screen. To effect this link, select a record and click the **Details** button.

An example of this inquiry screen is given in the following figure:

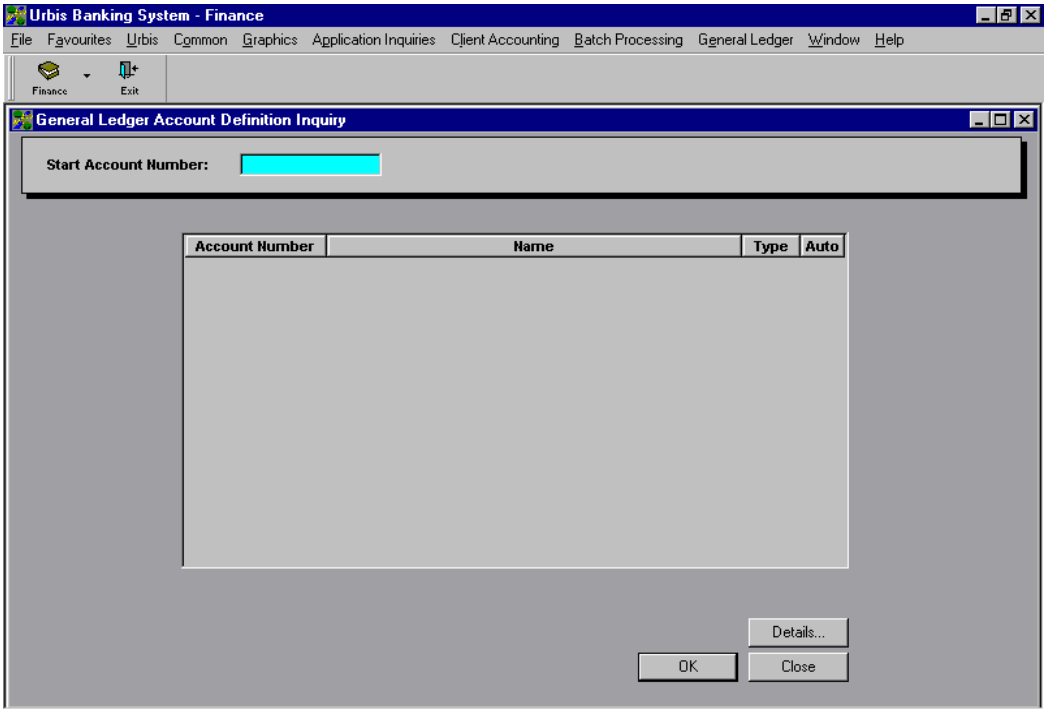

Figure 2–8. General Ledger Account Definition Inquiry screen

General Ledger Accounts Inquiry (GLSTI)

This screen lists all the general ledger accounts that are present on the system.

In order to recall details of the general ledger accounts, you must input an “Accounting Centre”. The system then starts the list with the general ledger accounts linked to that Accounting Centre. You may also enter an account number and currency in order to start the list at a specific point. The accounts are displayed in Account Name within Accounting Centre order.

You can link automatically from this screen to two other screens. To do this, select a record line and:

- Click the **AC Details** button to link to the General Ledger Account Details (GLSTM) screen.
- Click the **Statutory Information** button to link to the GL Statutory Information Maintenance (GLSRM) screen.

An example of this inquiry screen is given in the following figure:

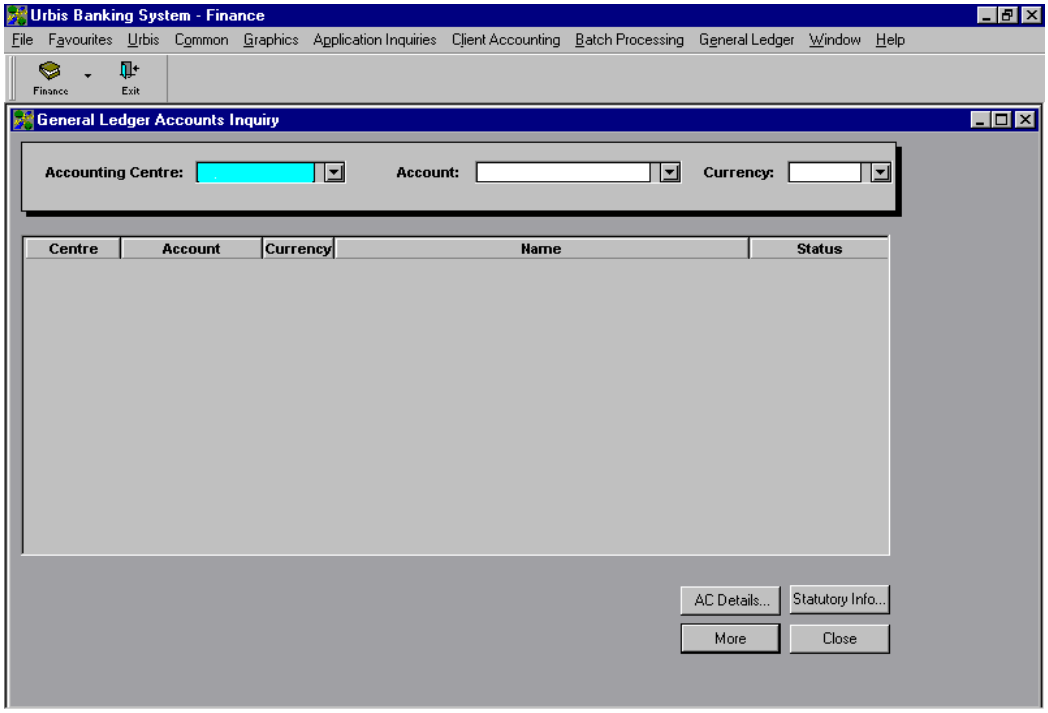

Figure 2–9. General Ledger Accounts Inquiry screen

General Ledger Account Summary (GLASI)

This inquiry shows a summary of the general ledger accounts that have a specified general ledger account number and currency. An option enables you to start the summary from a selected accounting centre.

In addition to the account type and status, the book and value balances are displayed for each account.

An example of this inquiry screen is given in the following figure:

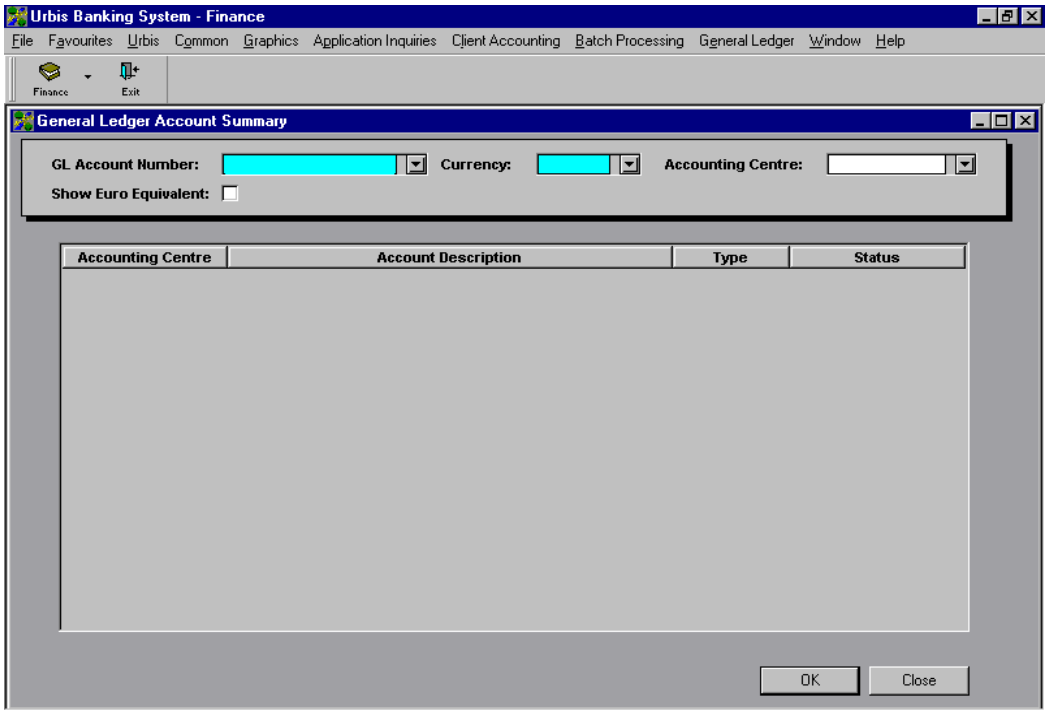

Figure 2–10. General Ledger Account Summary screen

General Ledger Account Details Inquiry (GLACI)

This inquiry shows full details of a specified general ledger account. You can use this inquiry to monitor the average value balances (both credit and debit) and turnover for the specified general ledger account.

An example of this inquiry screen is given in the following figure:

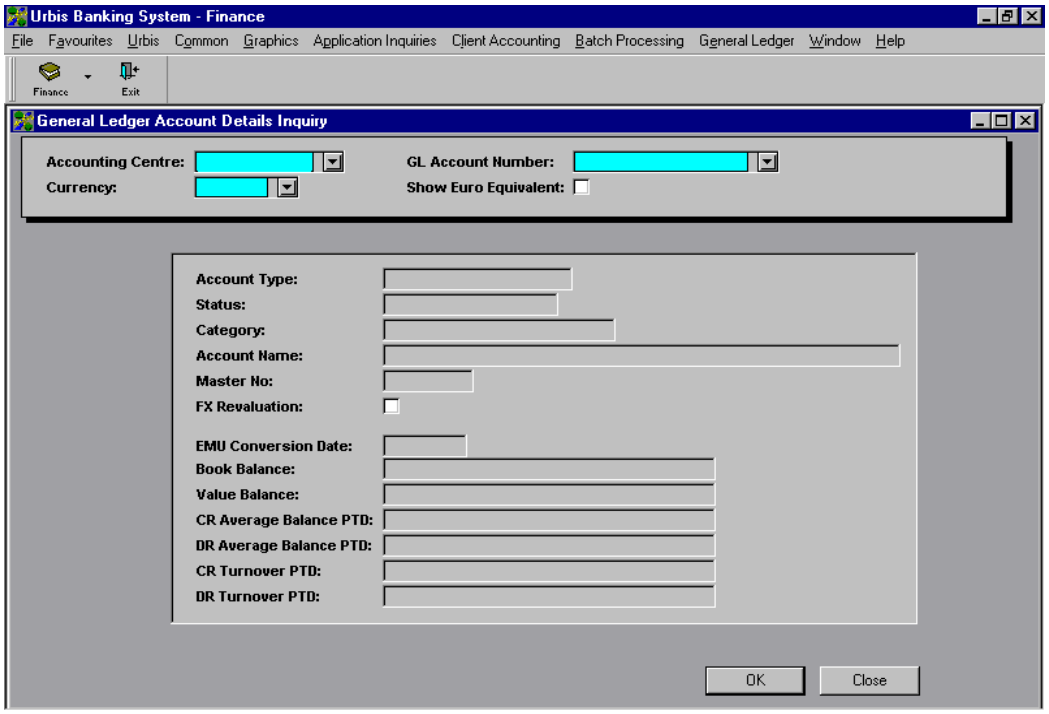

Figure 2–11. General Ledger Account Details Inquiry screen

Account History Inquiry (HISTA)

This inquiry shows historic information for a general ledger or client account. You can use this screen to inquire on the balance or interest outstanding on all the value dates from the starting date specified.

- If the “Show Amount” field is set to Balance, all historic balances are displayed together with the value dates.
- If the “Show Amount” field is set to Accrual, the Interest accrued on the account, together with any manual adjustments, is displayed for each value date.
- If the “Show Amount” field is set to Settled, the settled interest on the account is displayed, according to the interest settlement frequency for the account.

An example of this inquiry screen is given in the following figure:

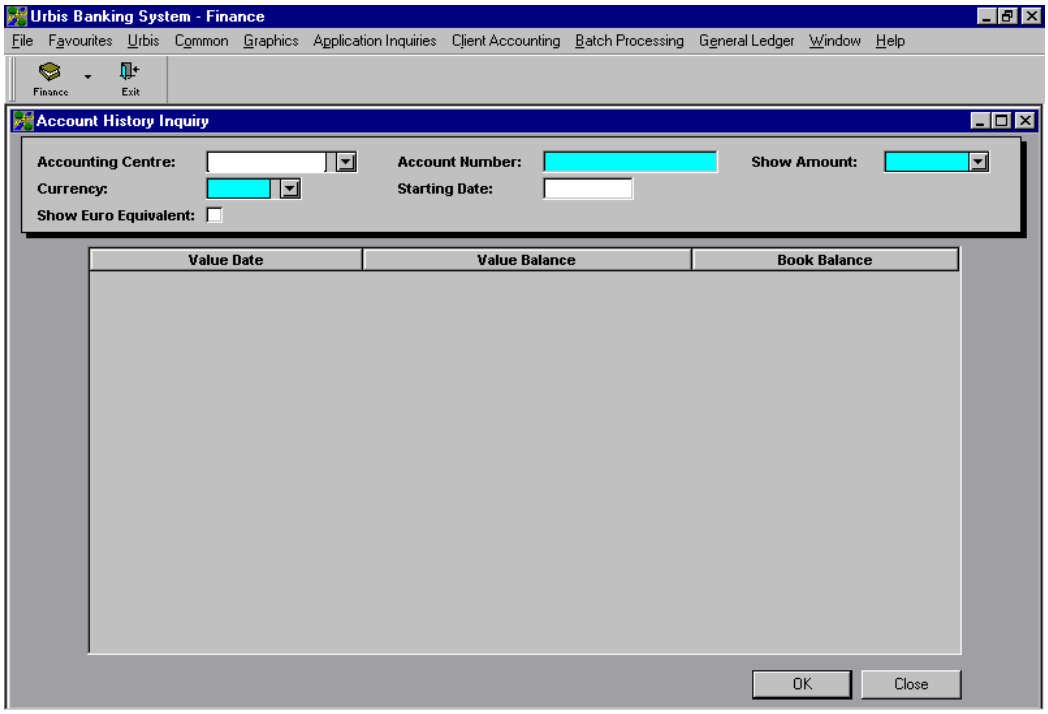

Figure 2–12. Account History Inquiry screen

Entering Batched Postings

The following screens are used to enter batched postings:

- The Batch Header (BHEAD) screen, used to open a batch
- The General Ledger Credit and General Ledger Debit screens (GLCR and GLDR), used to enter credits and debits to general ledger accounts
- The Batch Close (BCLOS) screen, used to close a batch

Notes: *The postings are not actioned until the POSTUPD - Update Postings report is run, see the* Core On-Demand Reports Guide *for details.*

The Cashier/Official Cheque Issue (CHEQA) and Cashier/Official Cheque Payment (CHEQP) screens cause postings to be raised that are given a batch reference, but these screens do not require manual batch opening and closing. These screens are described in detail in the Clients and Accounts Administration Guide.

The screens that enable you to inquire on the postings (from any source) made against a general ledger account are:

- The Postings Inquiry by Account (POSTI) screen
- The Postings Inquiry by Number (POSTN) screen
- The Statement Inquiry By Date (STMTD) screen
- The Journal Inquiry By Value Date (JRNLI) screen

The Loans Administration specific screens that enable you to inquire on the postings made against a general ledger account are:

- The LA Postings Inquiry By Account (LPSTI) screen
- The LA Postings Inquiry By Number (LPSTN) screen
- The LA Journal Inquiry By Date (LJRNI) screen

These screens are described in Postings Inquiries, later in this section.

If you have chosen to use batch authorisation, this is carried out using the following screens:

- The Batch Inquiry (BTCHI) screen
- The Batch Authorisation (CABAA) screen

These screens are described in Batch Authorisation, later in this section.

Batch Authorisation is set up using the BP-ATH-REQ-BATCH blueprint parameter. For details on blueprint parameters see “Blueprint Parameters” in the *Guide to Setting Up*.

Batch Header (BHEAD)

This screen is used to open a new or existing batch. Each batch must contain postings made in the same accounting centre. The number of the batch is assigned automatically, and appears on all screens within the batch.

The postings entered on this screen must have value dates of today or be forward dated. The GL Book Adjustment Batch Header (GLABH) screen must be used for back dated general ledger postings.

Do not enter the general ledger contra account number for general ledger postings.

After entering all details, the batch must be closed using the Batch Close (BCLOS) screen. If the batch does not balance, it may be closed "unreconciled".

Notes: *A batch will be closed automatically as unreconciled if the terminal is logged off whilst the batch is still open.*

Unreconciled batches will be purged, by the POSTLST - Batch Postings List report, after the expiry of the user defined period. This is defined by the retention period parameter BATCH-HIST (see "Retention Parameters" in the Guide to Setting Up*).*

A batch can only be deleted if it is open and unreconciled. If the batch header is deleted, all the associated postings are also deleted.

Each user may have one batch only open at any time.

The recommended procedure for reopening an unreconciled closed batch is:

1. Run POSTLST to identify the unreconciled batch number.
2. Select the Batch Header screen, enter the batch number and click **Inquire**.
3. When the screen is displayed, click **Change**.
4. Select the appropriate screen, needed to reconcile the batch.
5. Either select the specific general ledger account number or scroll through all the postings in the batch to identify the incorrect one. This can be changed, or deleted. Alternatively you can add a new posting or postings to the batch.
6. Use the Batch Close screen to close the batch.

Note: *You cannot use the Batch Header (BHEAD) screen to inquire on, or amend, postings entered on the Cash Wastes (CASHW) or GL Bulk Adjustments (GLADJ) screens.*

The following figure shows an example of the Batch Header screen.

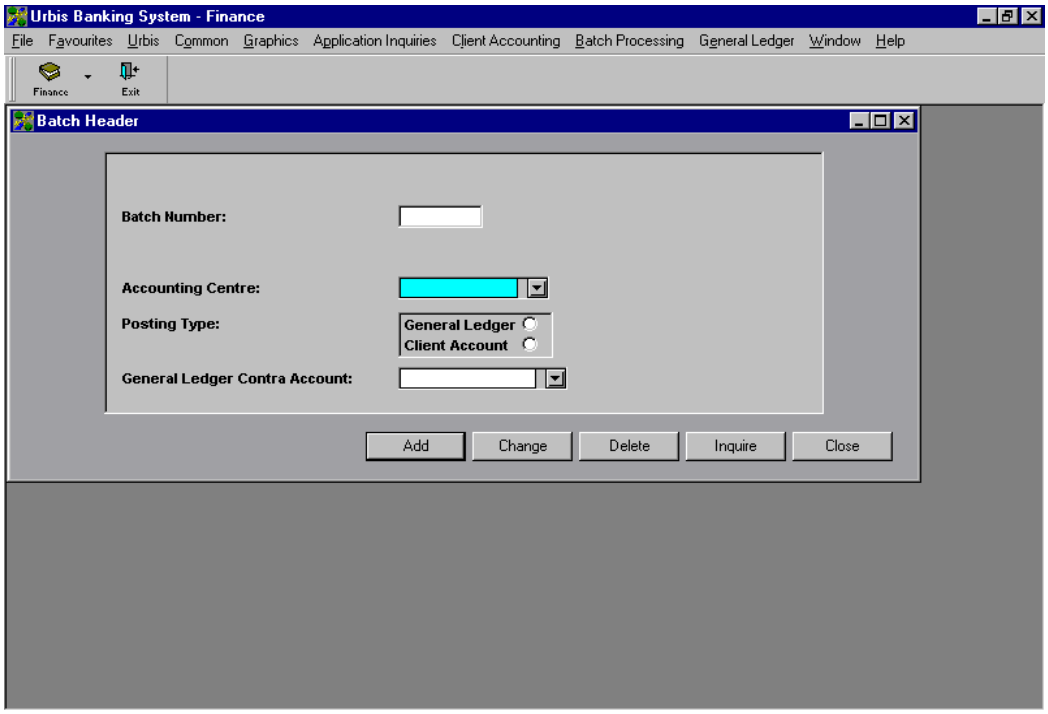

Figure 2–13. Batch Header screen

General Ledger Credit (GLCR)

This screen is used to make credit postings to “Standard” type general ledger accounts. For more information regarding the different types and categories of general ledger accounts see Section 1 “General Ledger Accounting Introduction”.

Note: *Before using this screen you must open a batch using the* Batch Header (BHEAD) *screen.*

Postings must balance within value date and grand total.

The “Currency” field enables batches of mixed currency postings to be made.

The “Reference Number” field contains a system generated number that uniquely identifies each posting. This enables you to refer to a specific posting for inquiry or change purposes. These reference numbers are shown on the Posting List report (POSTLST).

The “Value Date” field enables you to forward date general ledger postings. The maximum number of days forward that you may date a posting is determined by the blueprint parameter BP-FWD-VAL-DAYS, described in the *Guide to Setting Up the Wholesale System*. Users of the retail system should see BP-FWD-VAL-DAYS in the *Guide to Setting Up the Retail System*.

In the “Narrative” fields, you must either enter a narrative code for the text to be associated with the posting or enter some text manually.

The following figure shows an example of the General Ledger Credit screen.

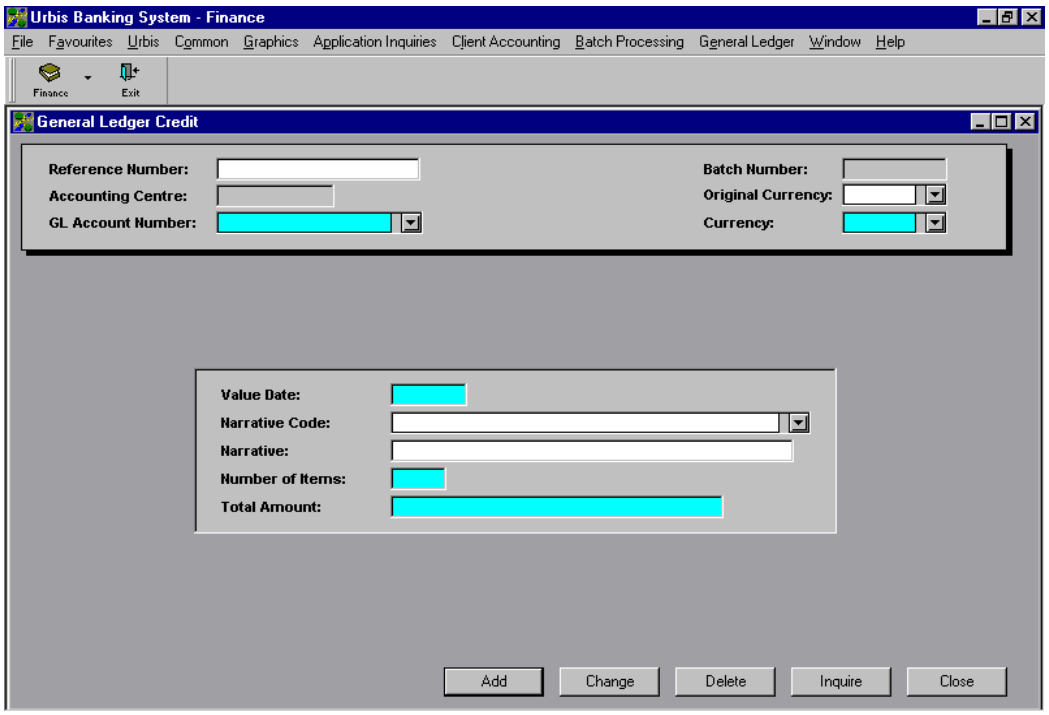

Figure 2–14. General Ledger Credit screen

General Ledger Debit (GLDR)

This screen is used to make debit postings to “Standard” type General Ledger accounts. For more information regarding the different types and categories of general ledger accounts see Section 1 “General Ledger Accounting Introduction”.

Notes: *You must open a batch using the Batch Header (BHEAD) screen before using this screen.*

Postings must balance within value date and grand total.

The “Currency” field enables batches of mixed currency postings to be made.

The “Reference Number” field contains a system generated number that uniquely identifies each posting, to enable you to refer to a specific posting for inquiry or change purposes. These reference numbers are shown on the Posting List report (POSTLST).

The “Value Date” field enables you to forward date general ledger postings. The maximum number of days forward that you may date a posting is determined by the blueprint parameter BP-FWD-VAL-DAYS, described in the *Guide to Setting Up the Wholesale System*. Users of the retail system should see BP-FWD-VAL-DAYS in the *Guide to Setting Up the Retail System*.

In the “Narrative” fields, you must either enter a narrative code for the text to be associated with the posting or enter some text manually.

The following figure shows an example of the General Ledger Debit screen.

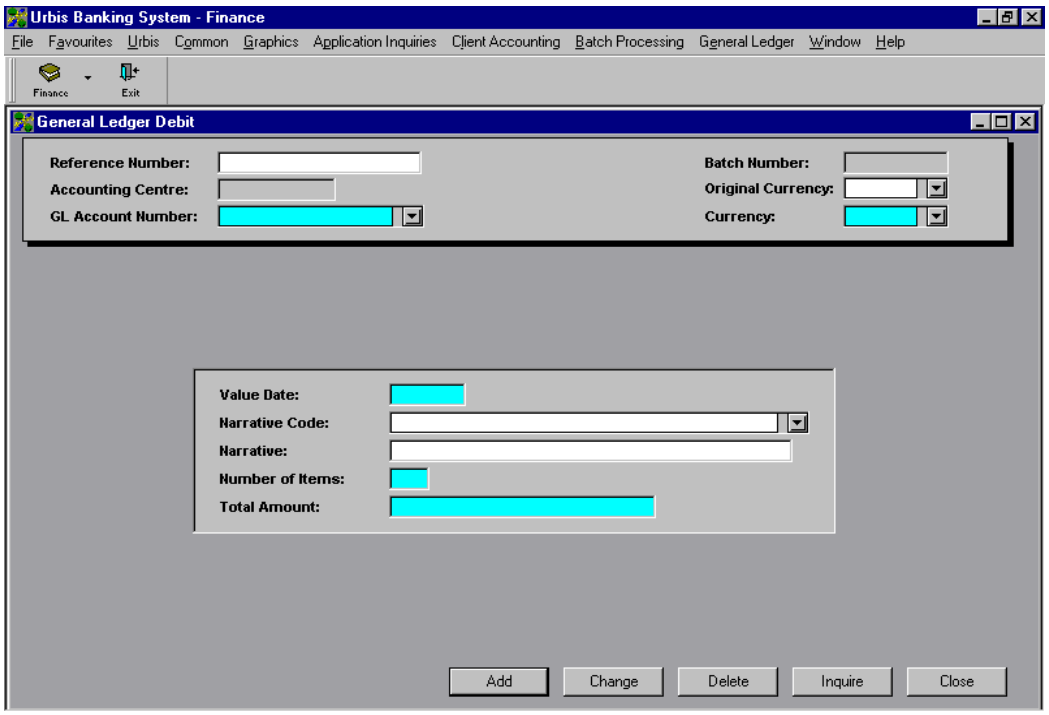

Figure 2–15. General Ledger Debit screen

Batch Close (BCLOS)

This screen is used to close a batch. The following expected values must be entered:

- Number of credit items
- Credit total (the total of all credit amounts irrespective of currency)
- Number of debit items
- Debit total (the total of all debit amounts irrespective of currency)

If these values differ from those calculated by the system, the calculated values are displayed. The batch can only be closed as reconciled if the expected and calculated values are the same. If they are different, the batch can either be:

- Closed as unreconciled, so that it can be updated at future date
- Corrected and closed as reconciled
- Deleted

If the batch consists of mixed currency postings, add the amounts of the postings together, regardless of the actual currency of each, to make the credit and debit totals. For example, if you enter the following postings:

- Credit 100,000 GBP
- Credit 400,000 USD
- Debit 50,000 GBP
- Debit 50,000 GBP
- Debit 100,000 USD
- Debit 300,000 USD

This gives a debit total of 500,000 and a credit total of 500,000. The system then checks that the totals you have entered agree with the totals it has calculated.

If you wish to reconcile the batch, you must enter the total credit and debit amounts and the total credit and debit items.

Once a batch has been reconciled it cannot be amended or deleted. As only real general ledger accounts need to balance, the totals might differ by the sum of postings to memo accounts.

Note: *You must only use this screen to close today and forward dated postings. For information on entering back-dated general ledger postings see the GL Book Adjustment Postings screens.*

The “Batch Priority” field enables you to select a priority value between 1 to 9 from the list. This field is stored in the BHEAD table for POSTUPD reference.

Note*:* *By default the value is 5. You can select a priority value between 1to 9 from the dropdown. If the priority value is not entered the system will assign default value for the*

corresponding batch type (C or G) as defined by user on the new default batch priority maintenance static table, BP.

The following figure shows an example of the Batch Close screen.

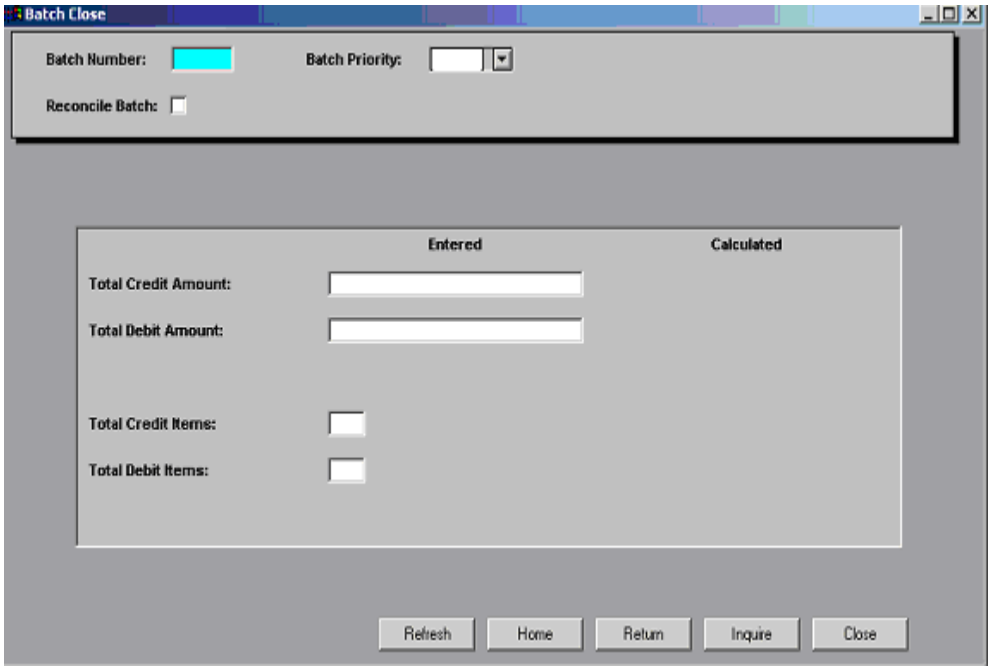

Figure 2–16. Batch Close screen

Entering Cash Postings

Cash Wastes (CASHW)

This screen is used to enter bulk, single or mixed currency credit and debit cash postings to general ledger accounts. These postings do not have to be of the same type or currency or have the same value date.

If several postings within a group of mixed currency postings are of the same currency, the currency code need only be entered for the first posting. All subsequent postings will default to that code until a new currency value is entered. Similarly, if a date or account is entered for a posting, subsequent postings will default to that date or account number until a new value is entered.

Notes: *Batches must balance within:*

- *Value date*
- *Individual currency total*
- *Grand total*

Postings must be made to "Standard" type general ledger accounts.

The Pay field is for use with client accounts only.

A batch may consist of the information entered on several screens. The batch header and batch close screens are not used with cash wastes. When a batch is successfully entered a batch number is automatically assigned to the screen. This number is used to recall the record when making inquiries. A currency and account number must be entered on the first line of the screen. Any values that are displayed as defaults may be overwritten.

To close a batch set up on this screen, either:

- Click the **Add** button to close a reconciled batch, or
- Switch 'On' the 'Batch End' field and click the **Add** button to close a batch as unreconciled.

The maximum number of days forward that you may date a posting is determined by the blueprint parameter BP-FWD-VAL-DAYS, described in the *Guide to Setting Up the Wholesale System*. Users of the retail system should see BP-FWD-VAL-DAYS in the *Guide to Setting Up the Retail System*. If you do not enter a value date for the first posting (on the first line), the as-of date is used. When you add postings, the account and value date default to the entries on the previous line.

When using the Cash Wastes (CASHW) screen, you cannot enter general ledger postings to different accounting centres in the same batch. If you need to enter postings between different accounting centres in your institution:

- First complete the screen for the paying accounting centre so that a payment is made to the cross-accounting centre account (this account is specified using the Cross Accounting Centre Rules (ACRLM) screen described in the *Guide to Setting Up*). Users of the Retail system should see Cross Accounting Centre Rules (ACRLM) in the *Guide to Setting Up the Retail System*.

- Complete the screen for the receiving accounting centre so that a payment is made from the cross-accounting centre account

Cash Wastes postings only can be manually reversed via the Cash Wastes (CASHW) screen. Automatic reversal is possible using the Batch Inquiry (BTCHI) screen. It is possible manually to create one batch to reverse an entire cash waste batch.

- Reversal number cannot be entered for a general ledger account, but must be entered to reverse a client account posting. For client account batch reversals, see the *Clients and Accounts Administration Guide*.
- The "Charge Code" on the Cash Wastes (CASHW) screen can either be blank or it can be the charge code of the posting being reversed.

***Note**: You cannot use the Cash Wastes (CASHW) screen to inquire on, or amend, postings entered on the Batch Header (BHEAD) or GL Bulk Adjustments (GLADJ) screens.*

The "Batch Priority" field enables you to select a priority value between 1 to 9 from the list. This field is stored in the BHEAD table for POSTUPD reference.

***Note**: By default the value is 5. If priority value is not entered the system will assign default value for the corresponding batch type (W) as defined by user on the new default batch priority maintenance static table, BP.*

The following figure shows an example of the Cash Wastes screen.

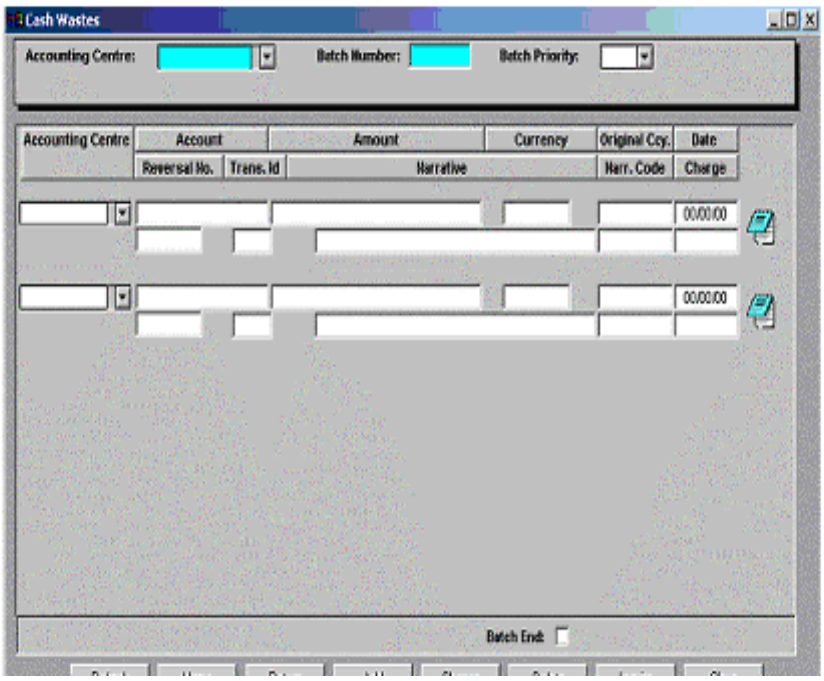

Figure 2–17. Cash Wastes screen

Batch Inquiry (BTCHI)

Use this screen to inquire on the status of the batches in Urbis. You can limit the search in various ways, either singly, or in any combination. If you are using batch authorisation, use this screen to begin the authorisation process.

- To limit the inquiry to batches of a certain status, enter the Status field
- To limit the inquiry to batches opened after a certain date, enter the Start Date field
- To limit the inquiry to batches after a certain number, enter the Start Batch Number field

From the Batch Inquiry (BTCHI) screen you can link to the following screens:

- Batch Header (BHEAD), where you can open an unreconciled batch
- Batch Close (BCLOS), where you can close an unreconciled batch
- Management Services Transaction Maintenance (CATRM), where you can enter a new paired transaction to the selected batch (see the *Clients and Accounts Administration Guide* for further details of paired transactions)
- Batch Detail Inquiry (BTDTI), where you can inquire on the individual transactions contained in a batch

To link to the above screens, highlight a batch, then:

- Click the **Details** button to link to the Batch Detail Inquiry (BTDTI) screen
- Click the **Transaction** button to link to the Management Services Transaction Maintenance (CATRM) screen
- Click the **Batch Close** button to link to the Batch Close (BCLOS) screen
- Click the **Batch Open** button to link to the Batch Header (BHEAD) screen.

You can use the Batch Inquiry (BTCHI) screen to reverse a batch that has been entered previously. A new batch is created with transactions that are the reverse of those in the original batch. To do this, highlight the batch you want to reverse and click the **Reverse** button.

If you are using batch authorisation, use the Batch Inquiry (BTCHI) screen to begin the batch authorisation process. Batch Authorisation is set up using the BP-ATH-REQ-BATCH and BP-DUAL-ATH blueprint parameters. The authorisation link will only work if these blueprint parameters have been set on your system. For more information on blueprint parameters, see the *Guide to Setting Up*. By selecting a batch with the status of Awaiting Authorisation (A) or Checked (K), you can link through to the Batch Authorisation (CABAA) screen to authorise the batch. To do this, highlight the batch you want to authorise and click the **Authorise** button.

The following figure shows an example of the Batch Inquiry (BTCHI) screen.

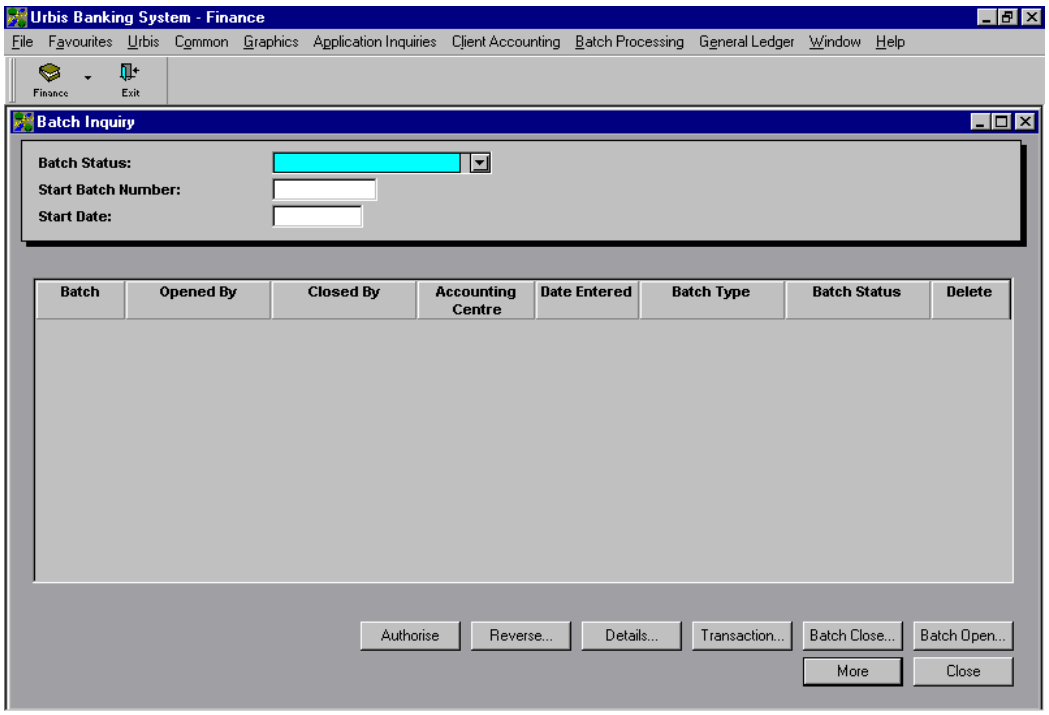

Figure 2-18. Batch Inquiry screen.

Batch Authorisation (CABAA)

Use this screen to authorise batches if you are using batch authorisation. Batch Authorisation is set up using the BP-ATH-REQ-BATCH and BP-DUAL-ATH blueprint parameters. For more information on blueprint parameters, see the *Guide to Setting Up*. The settings of these two blueprint parameters determine whether and how this screen is used:

- If both these blueprint parameters are set to “N”, then this screen is not used, and batches are given the status of “Closed Reconciled” without being authorised.
- If BP-ATH-REQ-BATCH is set to “Y” and BP-DUAL-ATH is set to “N”, batches must be authorised using this screen. A batch is given the status of “Awaiting Authorisation” until it has been authorised by a second user. It is then given the status of “Closed Reconciled”.
- If both blueprint parameters are set to “Y”. Batches must be authorised using this screen. A batch is given the status of “Awaiting Authorisation” until it has been checked by a second user. It is then given the status of “Checked”. A third user must then authorise the batch. It is then given the status of “Closed Reconciled”.
- If BP-EXTD-NARR is set to YES and extended narrative exists, icon is displayed and double clicking on it will open the pop up window to view the extended narrative.

A batch cannot be checked or authorised by the same person who created the batch. In order to authorise a batch, you must select it from the Batch Inquiry (BTCHI) screen and link through to the Batch Authorisation (CABAA) screen.

To check or authorise a batch, select the **Yes** radio button in the “Authorise” field.

The following figure shows an example of the Batch Authorisation (CABAA) screen.

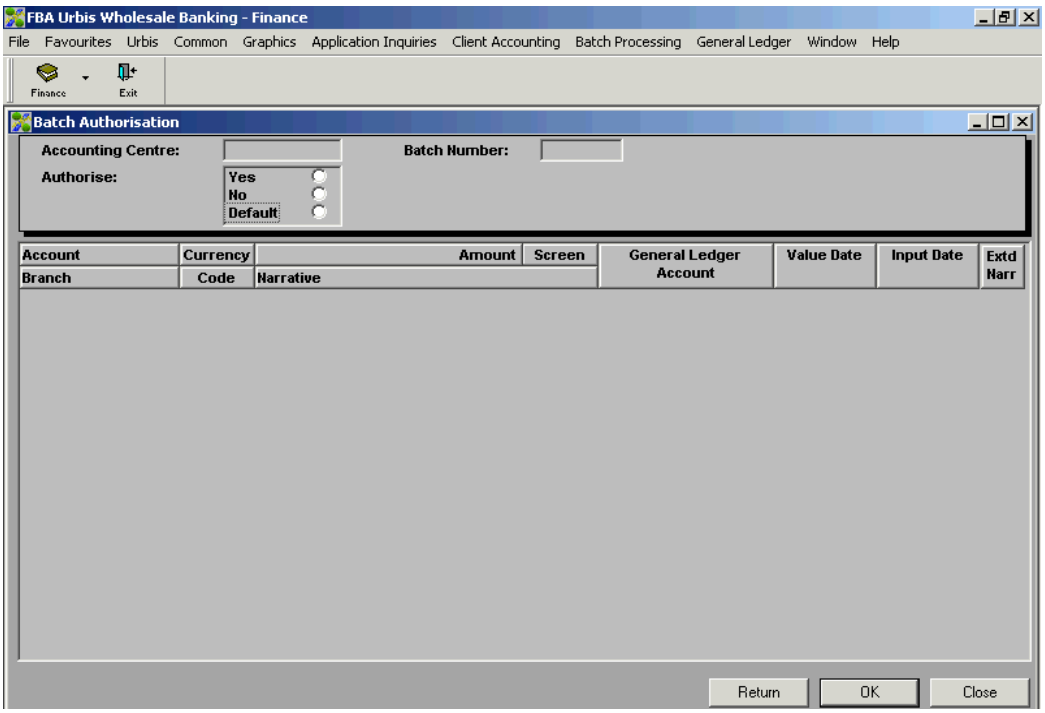

Figure 2-19. Batch Authorisation screen

Entering General Ledger Book Adjustment Postings

The following screens are used to enter back-valued general ledger postings. For further information on back-valued postings, see Section 1 “General Ledger Accounting Introduction”.

- The GL Book Adjustment Batch Header (GLABH) screen
- GL Book Adjustment Credit (GLACR) and GL Book Adjustment Debit (GLADR) screen
- GL Book Adjustment Batch Close (GLABC) screen

GL Book Adjustment Batch Header (GLABH)

This screen is used to either open batches of general ledger adjustment postings or to reopen unreconciled batches.

Each batch must contain postings made in the same accounting centre. The batch number is assigned automatically and appears on all the screens of a batch.

A batch being reopened must have been entered through this screen originally and not through the standard Batch Header (BHEAD) screen (see Batch Header (BHEAD) earlier in this section).

After entering the batch it must be closed using the GL Book Adjustment Batch Close (GLABC) screen.

Note: *A batch header can only be deleted if the batch has not been closed. If a batch header is deleted, all associated postings are deleted.*

The following figure shows an example of the GL Book Adjustment Batch Header screen.

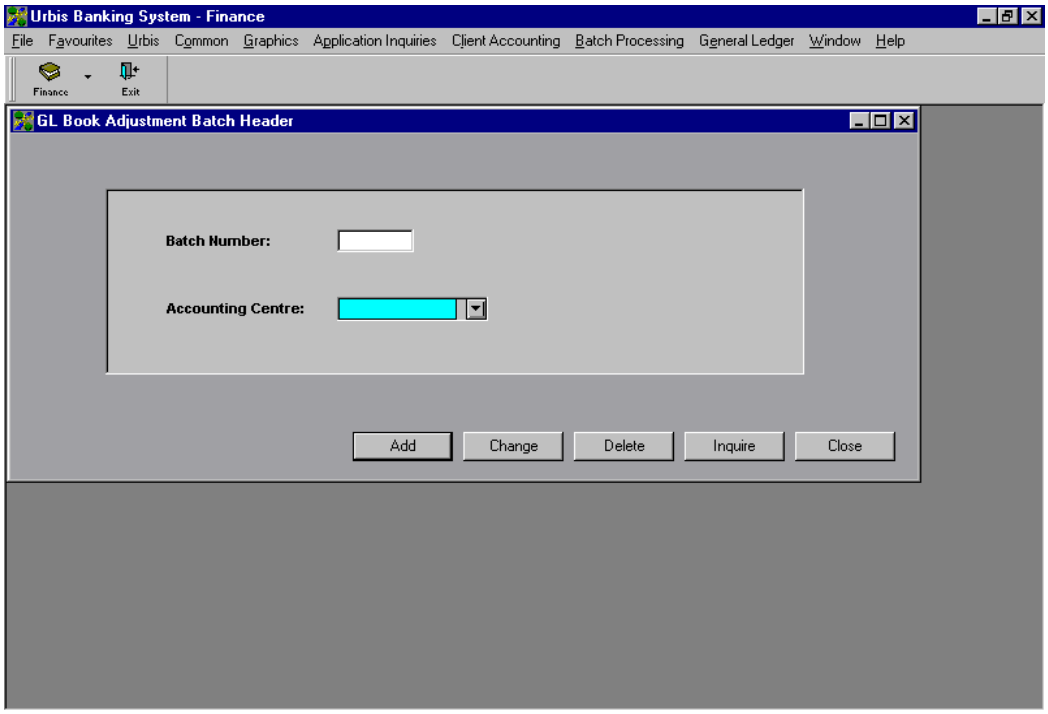

Figure 2–20. GL Book Adjustment Batch Header screen

GL Book Adjustment Credit (GLACR)

This screen is used to enter credit book adjustment postings to general ledger accounts with a Standard category.

You must open a batch using the GL Book Adjustment Batch Header (GLABH) screen before using this screen.

The “Posting Date” must be earlier than today's date but later than the current balance sheet rule-off date, set up on the Balance Sheet Rule Off Dates (GLROM) screen, described earlier in this section.

The “Value Date” must be on or before the “Posting Date” but later than the current balance sheet rule-off date.

The following figure shows an example of the GL Book Adjustment Credit screen.

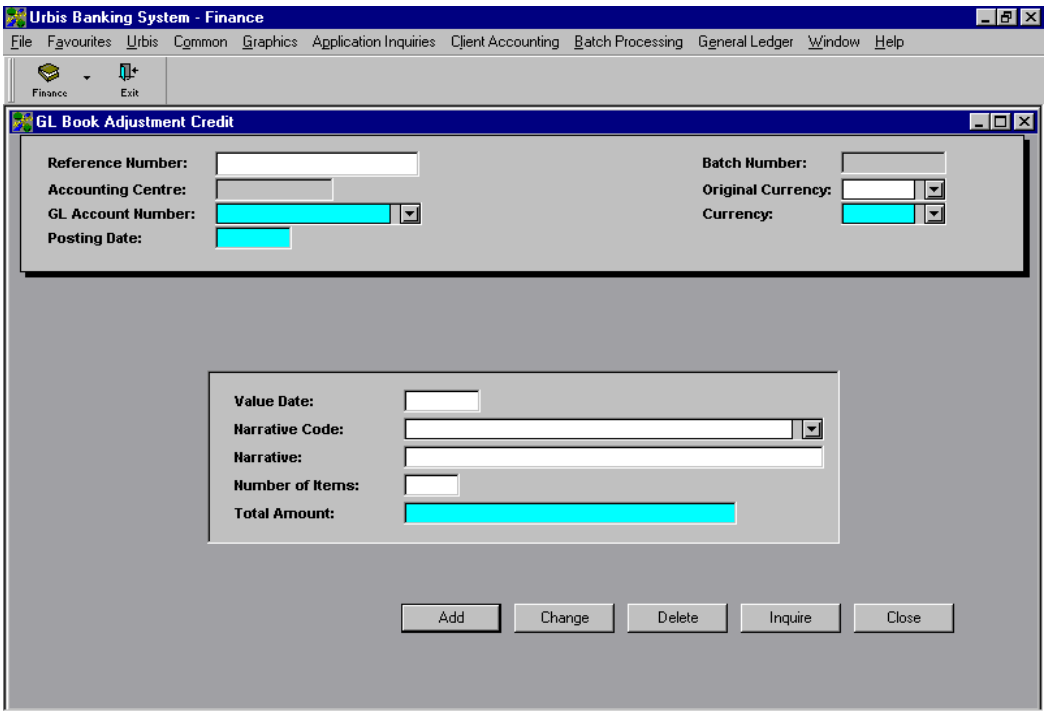

Figure 2–21. GL Book Adjustment Credit screen

GL Book Adjustment Debit (GLADR)

This screen is used to enter debit book adjustment postings to general ledger accounts with a Standard category.

You must open a batch using the GL Book Adjustment Batch Header (GLABH) screen before using this screen.

The “Posting Date” must be earlier than today's date but later than the current balance sheet rule-off date, set up on the Balance Sheet Rule Off Dates (GLROM) screen, described earlier in this section.

The “Value Date” must be on or before the “Posting Date” but later than the current balance sheet rule-off date.

The following figure shows an example of the GL Book Adjustment Debit screen.

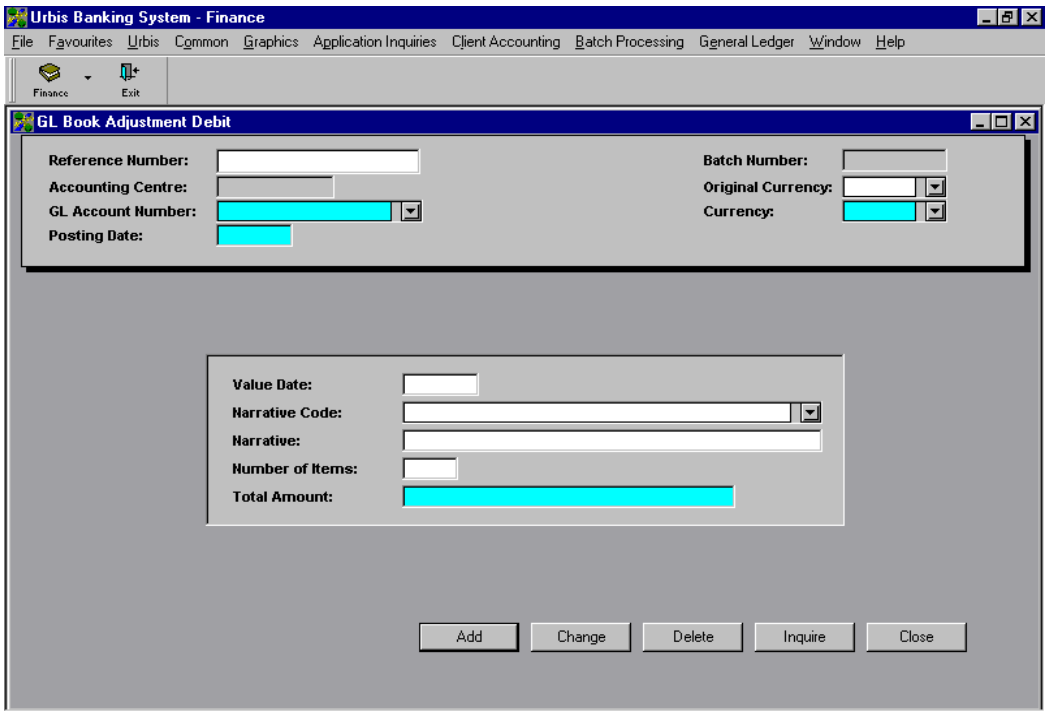

Figure 2–22. GL Book Adjustment Debit screen

GL Book Adjustment Batch Close (GLABC

Use this screen to close a batch of book adjustment postings. To reconcile a batch, you must enter:

- Number of credit items
- Credit total
- Number of debit items
- Debit total

If these values differ from those calculated by the system, the calculated values are displayed. The batch can only be closed as reconciled if the expected and calculated values are the same. If they are different, the batch can either be:

- Closed as unreconciled, so that it can be updated at future date
- Corrected and closed as reconciled
- Deleted (see Batch Header (BHEAD), described earlier in this section)

Adjustments to Memo accounts are not reconciled. If you enter a batch containing only adjustments to memo accounts, you must enter zero in the amounts and items fields. The amounts and items fields can only contain data for Real accounts.

***Note**: If the batch is closed as unreconciled, it is purged after a certain number of days (the actual number is defined at installation).*

When closing a batch as reconciled, it must balance within posting date, value date and grand total. When it balances, it is closed and marked for posting, after which it cannot be changed.

The POSTUPD - Update Postings report must be run to update all general ledger account postings from batch entry screens. This report can either be run in the overnight run, or activated in the system as a sleeping report. See the *On-Demand Reports Guide* for more information on this report. See the *Core On-Demand Reports Guide* for information on running reports. The POSTLST - Batch Postings List report can be used to obtain a list of all postings entered for a batch. This is described in the *On-Demand Reports Guide*.

The “Batch Priority” field enables you to select a priority value between 1 to 9 from the list. This field is stored in the BHEAD table for POSTUPD reference.

***Note**: By default the value is 5. You can select a priority value between 1 to 9 from the dropdown. If priority is not entered the system will assign default value for the corresponding batch type (A) as defined by user on the new default batch priority maintenance static table, BP.*

The following figure shows an example of the GL Book Adjustment Batch Close screen.

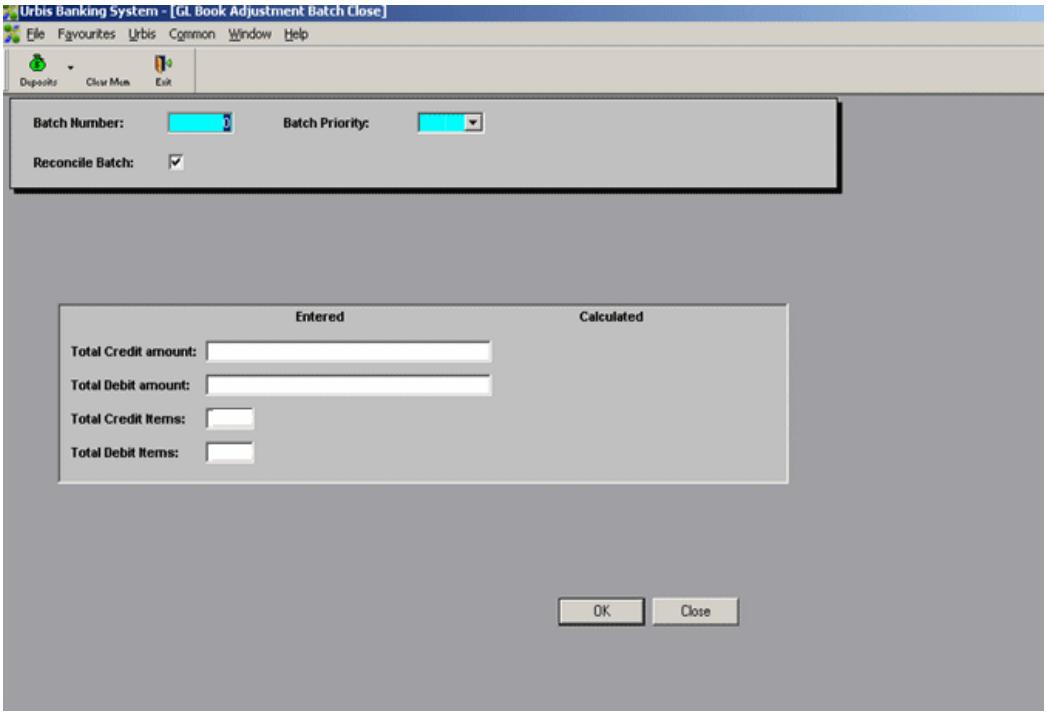

Figure 2-23. GL Book Adjustment Batch Close Screen

GL Bulk Adjustments (GLADJ)

The GL Bulk Adjustments (GLADJ) screen enables you to enter inter-accounting postings for general ledger accounts. You can also enter postings between general ledger accounts within an accounting centre.

The “Posting Date” must be earlier than today's date but later than the current balance sheet rule-off date, set up on the Balance Sheet Rule Off Dates (GLROM) screen, described earlier in this section.

The Header Accounting Centre is the accounting centre that controls the balancing of funds between accounting centres. This means that the inter-accounting centre account at this accounting centre will be updated for any transfer (this account is specified using the Cross Accounting Centre Rules (ACRLM) screen described in the *Guide to Setting Up the Wholesale System*. Users of the Retail system should see Cross Accounting Centre Rules (ACRLM) in the *Guide to Setting Up the Retail System*).

The postings do not need to be in the same currency or have the same value date.

If several postings within a group of mixed currency postings are of the same currency, the currency code need only be entered for the first posting. All subsequent postings will default to that code until a new currency value is entered. Similarly, if a date or account is entered for a posting, subsequent postings will default to that date or account number until a new value is entered.

Note: *Batches must balance within:*
- *Value date*
- *Individual currency total*
- *Grand total*

Postings must be made to “Standard” type general ledger accounts. For more information regarding the different types and categories of general ledger accounts see Section 1 “General Ledger Accounting Introduction”.

A batch may consist of the information entered on several screens. The batch header and batch close screens are not used with bulk adjustments. When a batch is successfully entered a batch number is automatically assigned to the screen. This number is used to recall the record when making inquiries.

To close a batch set up on this screen, either:

- Click the **Add** button to close a reconciled batch, or
- Switch 'On' the 'Batch End' field and click the **Add** button to close a batch as unreconciled.

Notes*: If you have completed the last line on the screen and have a reconciled batch, then you must use the Batch End field to close the batch. Otherwise you will be scrolled on to a blank screen.*

An accounting centre, currency and account number must be entered on the first line of the screen. Any values that are displayed as defaults may be overwritten.

The maximum number of days forward that you may date a posting is determined by the blueprint parameter BP-FWD-VAL-DAYS, described in the *Guide to Setting Up the Wholesale System*. Users of the retail system should see BP-FWD-VAL-DAYS in the *Guide to Setting Up the Retail System*. If you do not enter a value date for the first posting (on the first line), the as-of date is used. When you add postings, the account and value date default to the entries on the previous line.

For back-valued postings, both the posting and value dates must be back-valued, although not necessarily to the same date. If a posting is not back-valued, the posting date must be today.

Note: *You cannot use the GL Bulk Adjustments (GLADJ) screen to inquire on, or amend, postings entered on the GL Book Adjustment Batch Header (GLABH) or Cash Wastes (CASHW) screens.*

The "Batch Priority" field enables you to select a priority value between 1 to 9 from the list. This field is stored in the BHEAD table for POSTUPD reference.

Note*:* *By default the value is 5. You can select a priority value between 1 to 9 from the dropdown. If priority is not entered the system will assign default value for the corresponding batch type (A) as defined by user on the new default batch priority maintenance static table, BP.*

The following figure shows an example of the GL Bulk Adjustments screen.

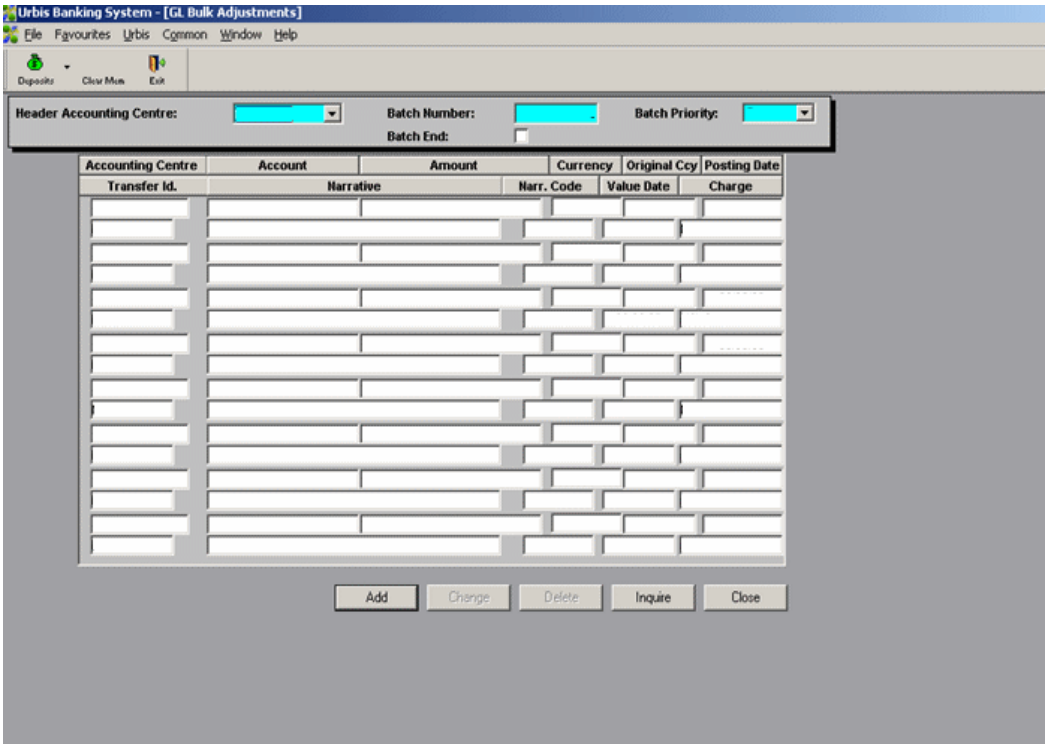

Figure 2–24. GL Bulk Adjustments screen

Making Automatic Payments via Standing Orders

Standing Orders Input (SOSTM)

The Standing Orders Input (SOSTM) screen can be used to enter postings between general ledger accounts in the form of standing orders. This can only be done for standard General Ledger accounts; it is not possible for Control or Backing General Ledger accounts. To define the standing order as being between two general ledger accounts, you must set the Standing Order Type field to 'GL to GL'.

You can enter a Standing order to credit a Nostro account without sending any payment messages. It is also possible to send payments messages for a standing order transaction that credits a Vostro or GL account.

The Cross Currency “Exchange Rate”, “Bought Accounting Centre” and “Sold Accounting Centre” fields are mandatory when different currencies are entered in the Debit and Credit Account Number fields. The “Currency of Transfer” cannot be changed. This can only be done by deleting the standing order and entering a new one.

For new standing order, the 12 digit unique standing order number is generated by the system and when linking from Standing Orders Inquiry Lead (SOSLI) or Standing Orders Authorisation Queue (SOAHI), the standing order number will be pre-filled.

The “Transfer Minimum Amount” and “Transfer Type” fields are mandatory when the Payment Type is “Minimum Balance”. “Transfer Minimum Amount” is mandatory when the Payment Type is “Above Maximum Balance”.

Double clicking on the icon next to the posting narrative field will open the pop up window to show/edit the extended posting narrative.

Standing orders can also be set up between General Ledger and External accounts and between General Ledger accounts and client accounts.

The following figure shows an example of the Standing Orders Input screen.

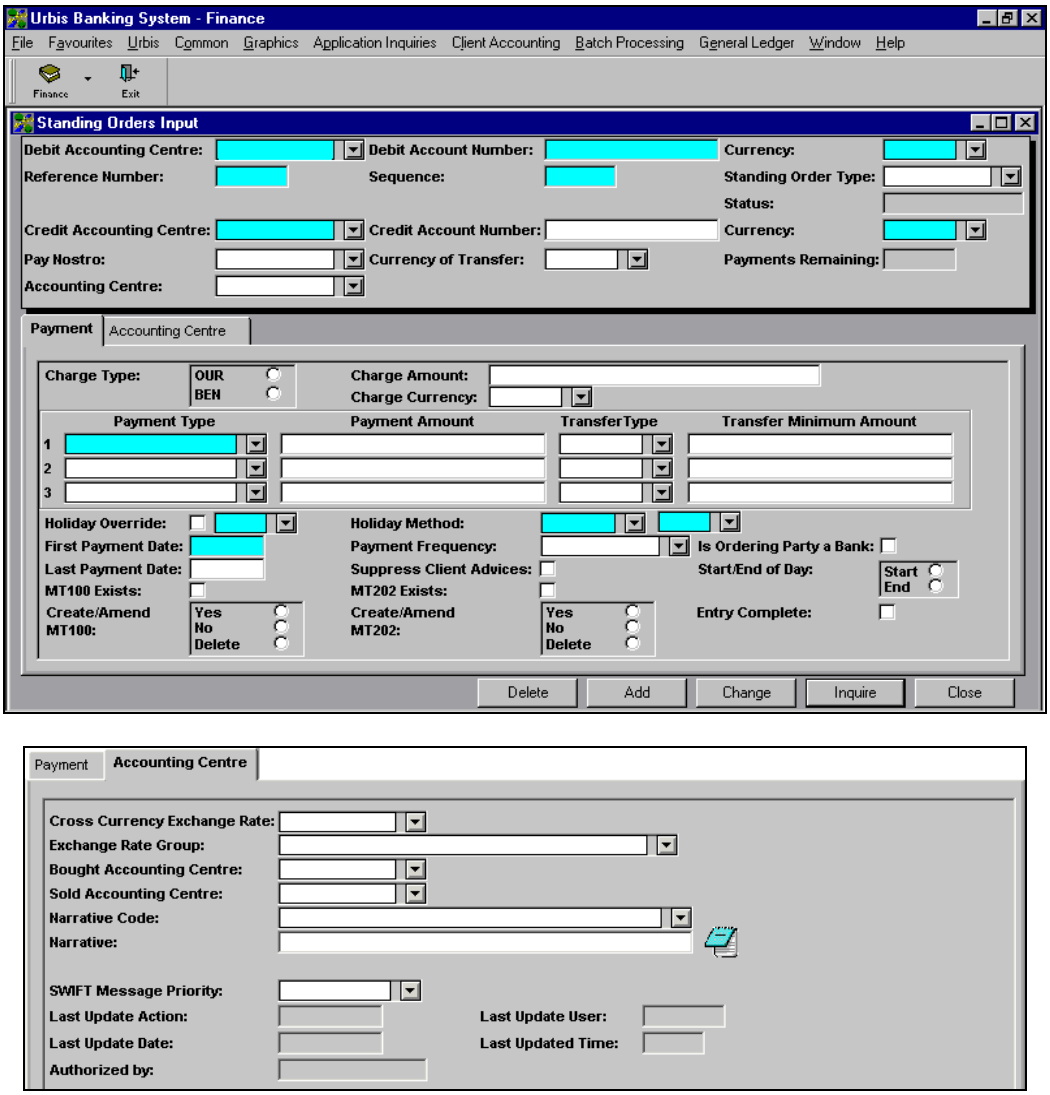

Figure 2–25. Standing Orders Input screen

Multiple Transfers

You can specify all accounting centres and/or all currencies for a single standing order of the type GL (where the payment type, described below, is “Full Balance”). This enables transfers on either a “many to one” or a “many to many” basis, and so avoids the need for repetitive data-entry. The purpose of this facility is to enable you to easily reset general ledger account balances to zero following period end.

For a many to one transfer, enter asterisks in the “Debit Accounting Centre” and/or currency part of the “Debit Account Number” field, to denote where a multiple transfer is required. Enter the required accounting centre and currency mnemonics in the “Credit Accounting Centre” and currency part of the “Credit Account Number” field.

For a many to many transfer, enter asterisks in the “Debit Accounting Centre” and “Credit Accounting Centre”, and/or currency parts of both the “Debit Account Number” and “Credit Account Number” fields, to indicate where the multiple transfer is required.

Payment Type Field

Each payment amount must be identified as being of a certain type (“Payment Type”), using one of five options. The amount entered as the “Payment Amount” is transferred according to this payment type, as follows:

- Fixed Amount (AM)
  A stated fixed amount (“Payment Amount”) is to be transferred
- Full Balance (FL)
  The whole balance of the account is to be transferred, leave “Payment Amount” blank
- Minimum Balance (MN)
  The amount required to “top up” an account to a stated minimum balance is to be transferred. Enter the minimum balance in the “Payment Amount” field
- Maximum Amount (MX)
  The balance in full, up to a stated maximum amount, is to be transferred. Enter the maximum value in the “Payment Amount” field
- Above Maximum Balance (OA)
  The amount above a stated maximum balance is to be transferred. Enter the value of the maximum balance in the “Payment Amount” field

The numbers 1, 2 and 3 are used to relate payment types with the different payments involved with the standing order, as follows:

1 - first payment
2 - interim payments
3 - final payment

You must enter the first payment amount; if you do not enter amounts 2 and 3 the system assumes you wish to make equal payments and uses the first payment amount for the interim and final payments.

Both the payment amount and type can be amended at any time prior to the first payment. Once a payment has been made the amount cannot be changed.

Payment and Transfer Type

With Payment Type “Above Maximum Balance”, Standing Orders can be limited to those that involve significant amounts only. This reduces the extent to which transfers of amounts that are not fixed are made when the amounts themselves are so small as to limit the usefulness of the standing order. The amount of the balance you wish to maintain is entered under “Payment Amount”. Any amount above this value is transferred only if it is not less than the “Transfer/Minimum Amount”.

With Payment Type “Minimum Balance” standing orders may be similarly limited to significant amounts, or you can define conditions that ensure that accounts are only “topped up” when necessary and by minimum transfer amounts. The amount of the balance you wish to maintain is entered under “Payment Amount”. If the account balance is below this value a transfer is made to the account, in order to make up the balance, subject to the following conditions associated with Transfer Type codes:

1 The posting takes place only if the amount to be transferred to make up the balance is greater than that entered under “Transfer/Minimum Amount”.

2 The amount to be transferred is equal to the value entered as the “Transfer/Minimum Amount”, irrespective of the actual amount required to make up the balance.

3 The amount to be transferred is equal to the actual amount required to make up the balance, plus the value entered under “Transfer/Minimum Amount”.

Transfer Types and Minimum Amounts need not be defined for Payment Types “Fixed Amount”, “Full Balance” or “Maximum Amount”.

Authorisation

“Authorization” and “Reject” will be allowed if the blue print BP-SO-AUTH is set to “Y”. This blue print indicates if the system uses standing order authorization functionality. Authorisation is disallowed for the user who made the Last Add/Update. The Reject operation will remove the unauthorised record.

When a new Standing Order is added with status “Unauthorised”, the last update details such as Last Update Action, Last Update User, Last Update Date, Last Update Time and Authorized By are displayed.

Whenever an existing standing order is changed, then all fields that are changed will be highlighted during authorization. For new standing orders, screen fields will not be highlighted even if further changes are made during authorization.

User will be unable to authorise if the Entry Complete indicator is not set.

Deleting a Standing Order

Standing orders cannot be cancelled, but may be deleted. This has the effect of giving the standing order the status of "Deleted".

Standing Orders Master Details Inquiry (SOSTI)

This inquiry shows details of a selected standing order for a specific general ledger account.

Note: *The Reference Sequence Number field is filled by the system; you cannot enter a value in this field.*

An example of Standing Order Master Details Inquiry screen is given in the following figure:

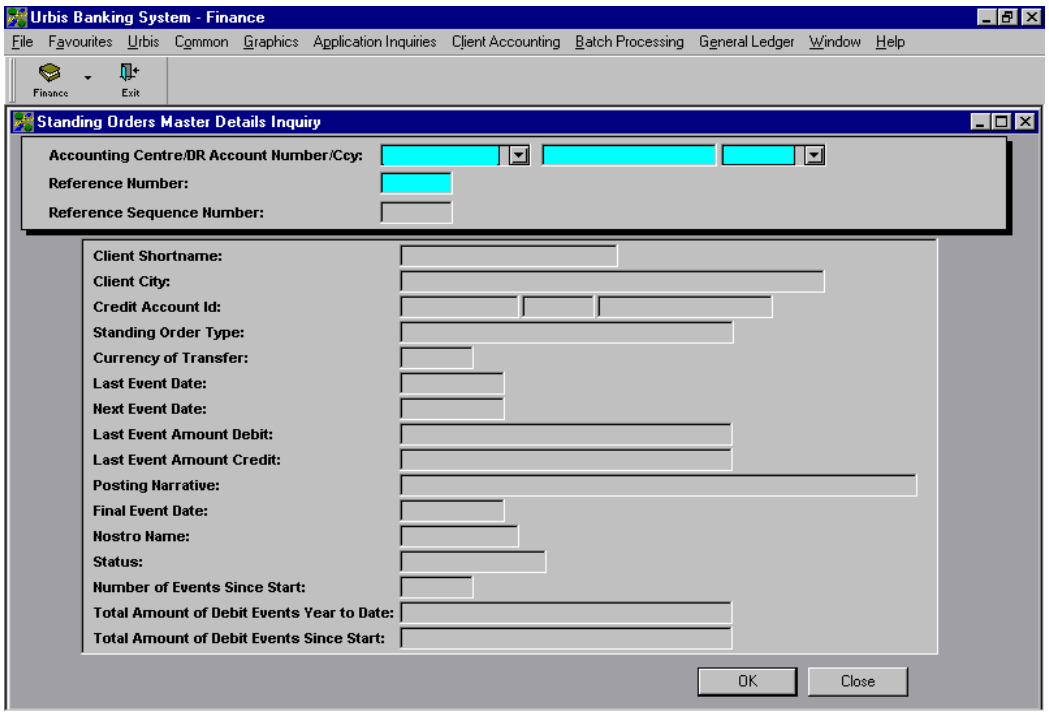

Figure 2–26. Standing Order Master Details Inquiry screen

Postings Inquiries

Postings Inquiry By Account (POSTI)

This inquiry shows the amount and description of the postings made to a specified General Ledger account from a specified date. Only events that cause the balance to be updated are displayed. The inquiry screen Statement Inquiry By Date (STMTD), can also be used to view the current details of postings made to a General Ledger or client account. Statement Inquiry By Date (STMTD) also displays the last posting date, and the opening and closing balances for the account inquired upon. If extended narrative exists, icon is displayed and double clicking on it will open the pop up window to view the extended narrative.

If the POSTUPD - Update Postings report is running as a sleeping report, the postings are made as soon as transactions are entered. In this situation, the Postings Inquiry By Account (POSTI) screen will display the current position. This report is described in the *On-Demand Reports Guide*.

After the end-of-day operations have been performed for a day, all transactions will have been generated and all postings made to the General Ledger account. An account's postings for that day can then be displayed on the Postings Inquiry By Account (POSTI) screen. Either the batch number (for all manual postings) or the contract number (for contract generated postings) will be separately displayed against the posting line.

If you have the Loans Administration (LA) module, you can link to the LA Postings Inquiry by Account (LPSTI) screen as follows, click on **LA Postings**.

An example of the Postings Inquiry By Account screen is given in the following figure:

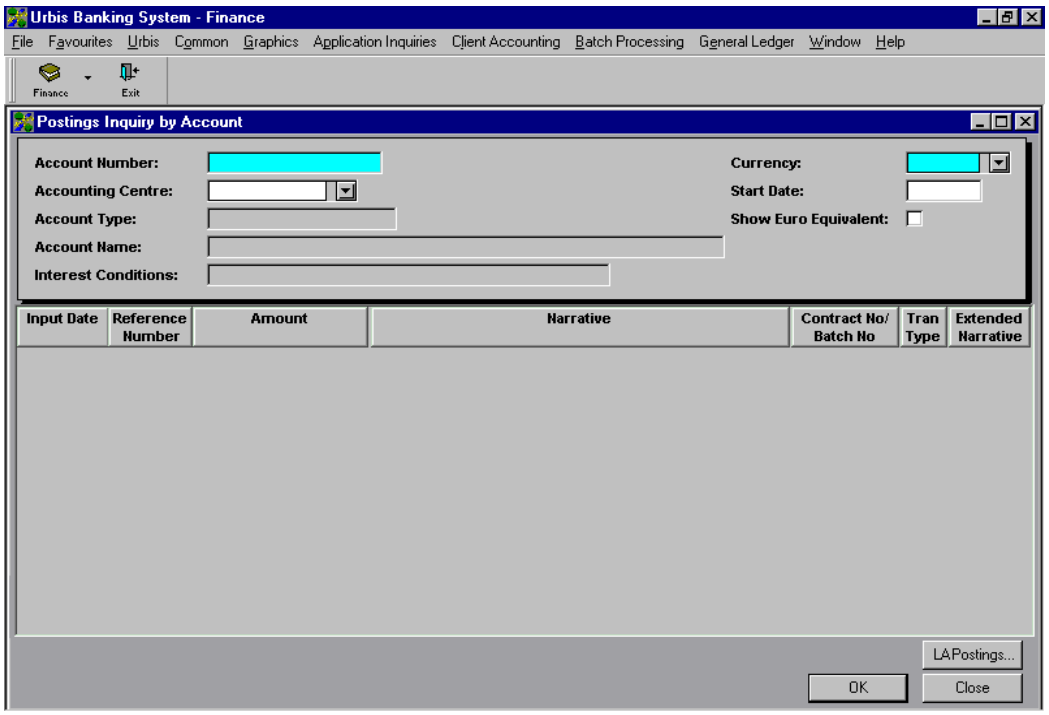

Figure 2–27. Postings Inquiry By Account screen

Postings Inquiry By Number (POSTN)

This inquiry shows the amount and description of all postings made to a General Ledger account included on the statement specified. An option enables you to produce the inquiry from a selected date. If extended narrative exists, icon is displayed and double clicking on it will open the pop up window to view the extended narrative.

Note: *The "Statement Number" is updated each time the CASTMTS - Client Account Statements report is run.*

Either the batch number (for all manual postings) or the contract number (for contract generated postings) will be separately displayed against the posting line.

From this screen it is possible to link to the LA Postings Inquiry By Number (LPSTN) screen, if you have the Loans Administration (LA) module, highlight the required postings entry, and click the **Postings** button.

An example of the Postings Inquiry By Number screen is given in the following figure:

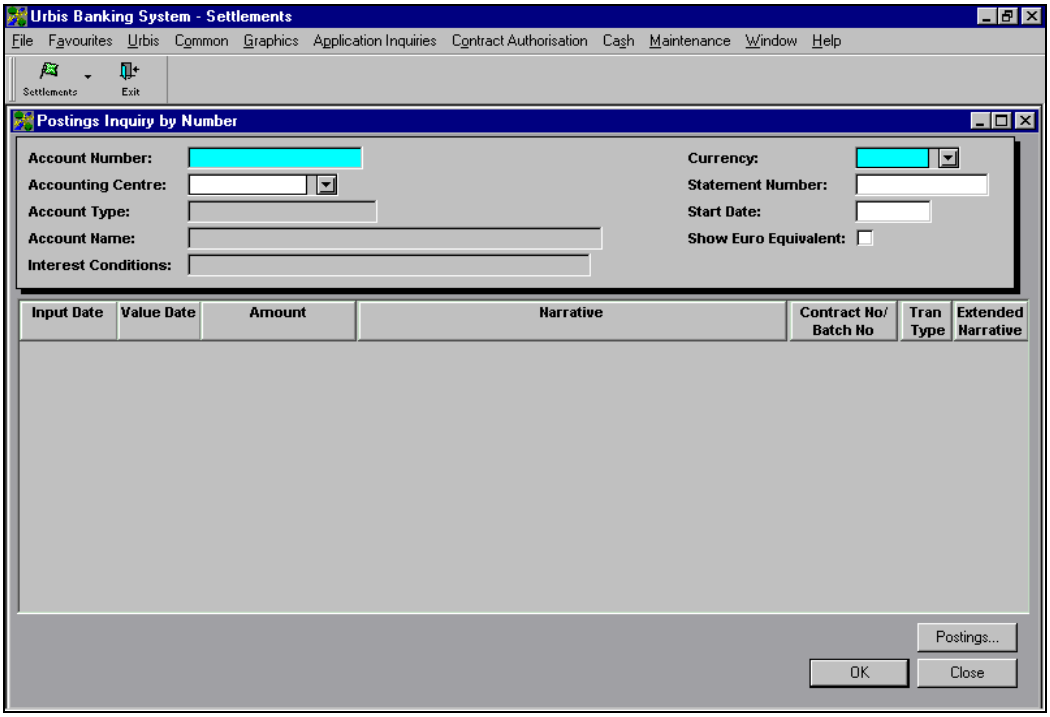

Figure 2–28. Postings Inquiry By Number screen

Statement Inquiry By Date (STMTD)

This inquiry shows the amount and description of postings made to a General Ledger account from a specified input date. Opening and closing book balances are also displayed. Either the batch number (for all manual postings) or the contract number (for contract generated postings) is separately displayed against the posting line. If extended narrative exists, icon is displayed and double clicking on it will open the pop up window to view the extended narrative.

The Statement Inquiry By Date (STMTD) screen can only display up-to-date details if the POSTUPD - Update Postings report is running. After the end-of-day operations have been performed the postings made to the General Ledger and Client backing accounts for that day can be displayed.

An example of this inquiry screen is given in the following figure:

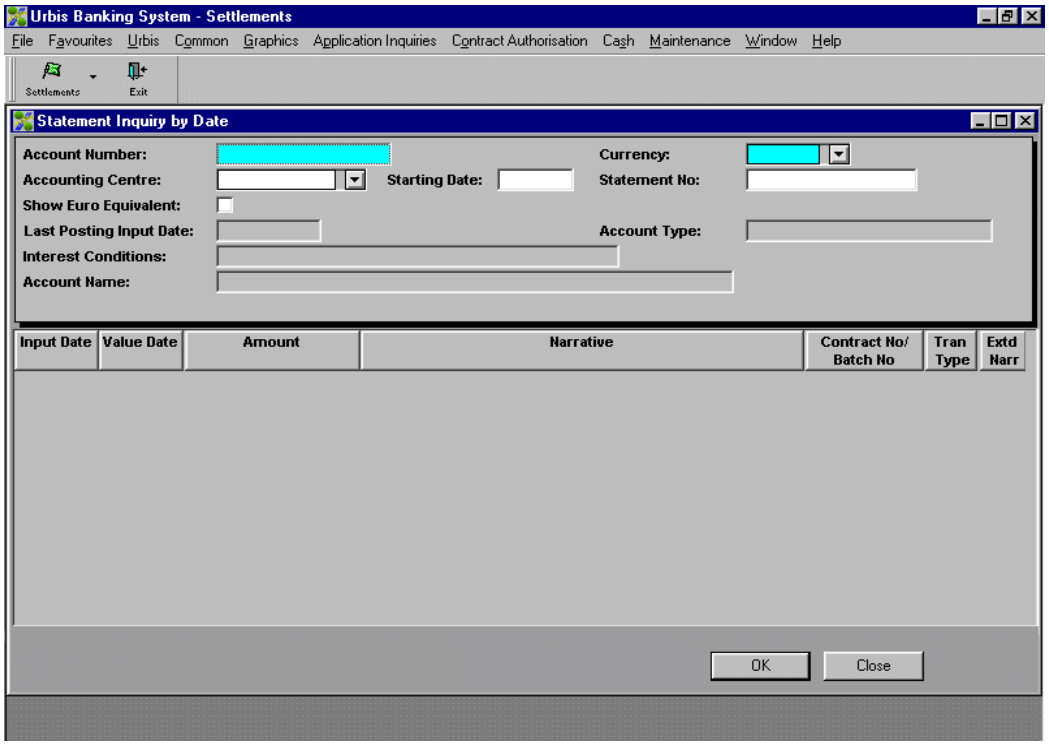

Figure 2–29. Statement Inquiry By Date screen

Journal Inquiry By Value Date (JRNLI)

This inquiry shows the amount and description of postings made to a General Ledger account from a specified value date. The book and value balances are also displayed.

The Journal Inquiry By Value Date (JRNLI) screen can only display up-to-date details if the POSTUPD - Update Postings report is running. After the end-of-day operations have been performed the postings made to the General Ledger and Client backing accounts for that day can be displayed. Either the batch number (for all manual postings) or the contract number (for contract generated postings) will be separately displayed against the posting line.

If extended narrative exists, icon is displayed and double clicking on it will open the pop up window to view the extended narrative.

An example of this inquiry screen is given in the following figure:

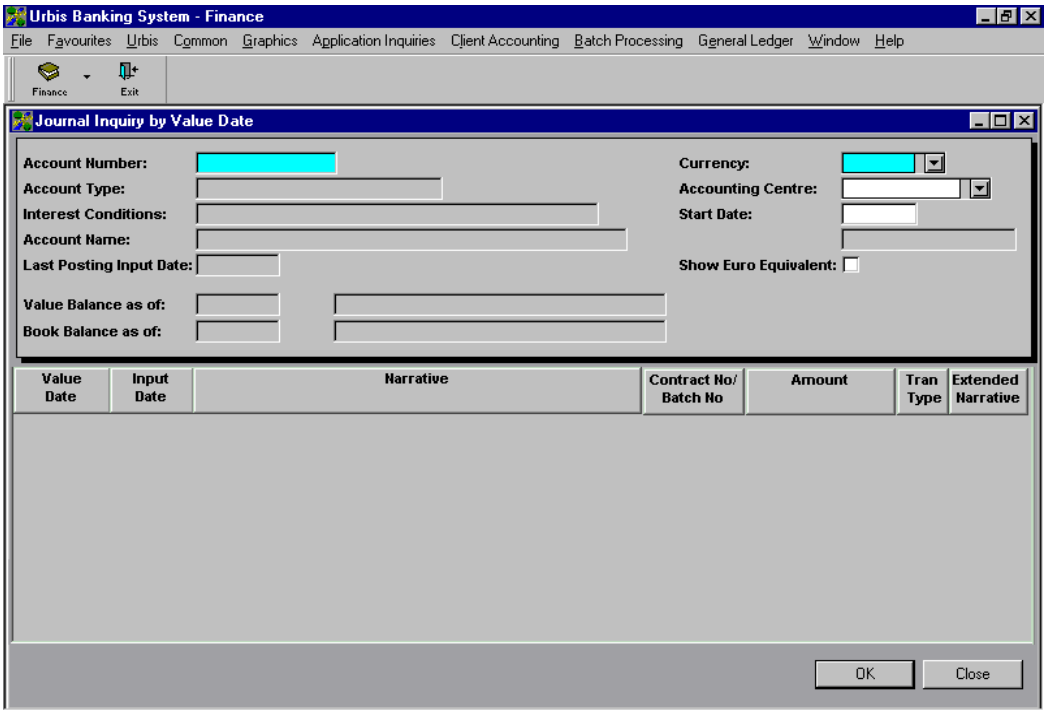

Figure 2–30. Journal Inquiry By Value Date screen

General Ledger Posting Inquiries for Loans Administration

The following inquiries are for users of the Loans Administration module only.

LA Postings Inquiry By Account (LPSTI)

This inquiry shows the amount and description of the loans administration postings made to a specified General Ledger account from a specified date. Only events that cause the balance to be updated are displayed.

This screen fulfils a similar function to the Postings Inquiry By Account (POSTI) screen, but also displays the client source from or to which the posting was made. The client source, in this context, can be defined as the originator or receiver of a payment to or from a general ledger account. For example, this could be the drawdown borrower or a participant.

This screen displays multiple postings from a nominated account, currency, branch, start date and batch number. It displays the additional data item - Batch No.

An example of the LA Postings Inquiry By Account screen is given in the following figure:

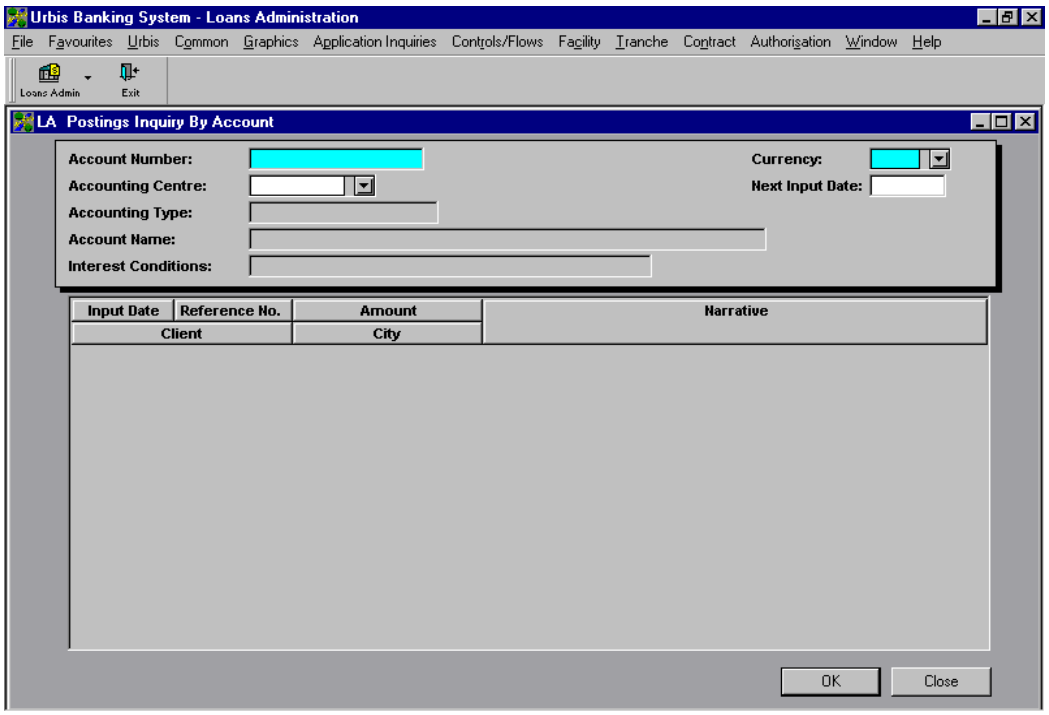

Figure 2–31. LA Postings Inquiry By Account screen

LA Postings Inquiry By Number (LPSTN)

This inquiry shows the amount and description of all loans administration postings made to a General Ledger account included on the statement specified. An option enables you to produce the inquiry from a selected date.

This screen fulfils a similar function to the Postings Inquiry By Number (POSTN) screen, but also displays the client source from or to which the posting was made. The client source, in this context, can be defined as the originator or receiver of a payment to or from a general ledger account. For example, this could be the drawdown borrower or a participant.

An example of the LA Postings Inquiry By Number screen is given in the following figure:

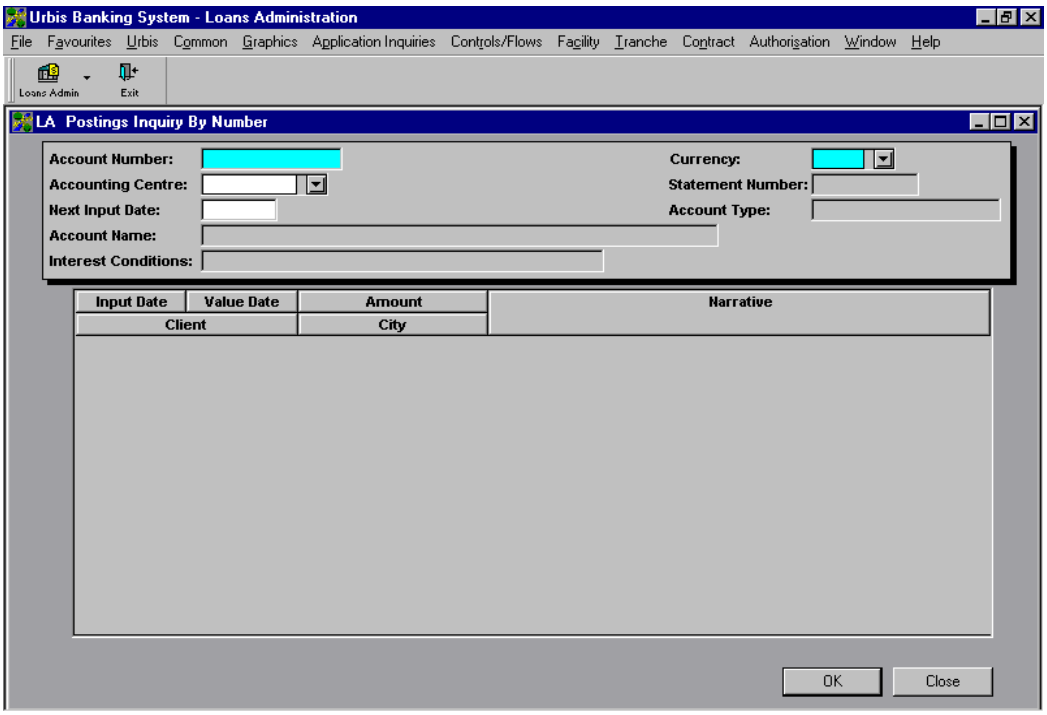

Figure 2–32. LA Postings Inquiry By Number screen

LA Journal Inquiry By Date (LJRNI)

This inquiry shows the amount and description of postings made to a General Ledger account from a specified value date. The book and value balances are also displayed.

The LA Journal Inquiry By Date (JRNLI) screen can only display up-to-date details if the POSTUPD - Update Postings report is running. After the end-of-day operations have been performed the postings made to the General Ledger and Client backing accounts for that day can be displayed.

This screen fulfils a similar function to the Journal Inquiry By Value Date (JRNLI) screen, but also displays the client source from or to which the posting was made. The client source, in this context, can be defined as the originator or receiver of a payment to or from a general ledger account. For example, this could be the drawdown borrower or a participant.

An example of the LA Journal Inquiry By Date screen is given in the following figure:

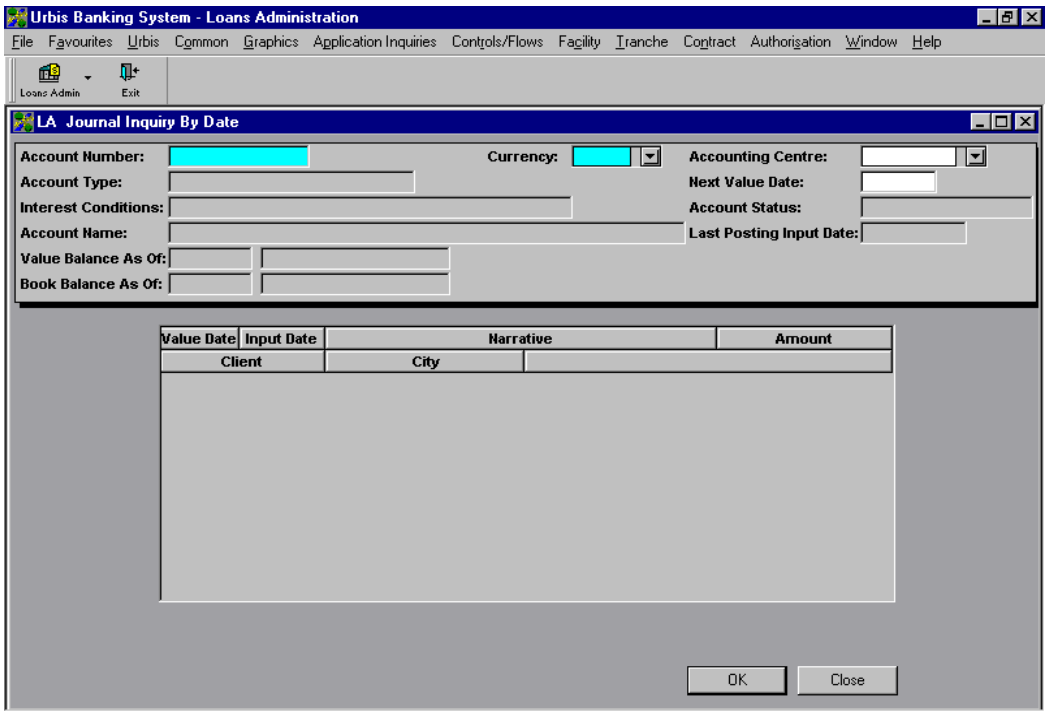

Figure 2–33. LA Journal Inquiry By Date screen

Setting Up Income Statements and Balance Sheets

Income Statements and Balance Sheets

The income statements and balance sheets are parameterised reports. The following types of report can be produced:

- General Ledger Balance Sheet - GLBSHEET
- General Ledger Trial Balance - GLTBAL
- Average Balance Sheet - AVGBAL
- Income statements (reports Income Statement (1) - STMNTINC and Income Statement - INCOMESTMT)
- Statement of Condition - STMNTCON

Each type of report may be set up in up to nine layouts. The formats of these reports are defined using the Trial Balance/Balance Sheet (TBBSM) screen. The format parameters can be listed in the Income Statement and Balance Sheet Layouts - TBBSLST report.

The system holds account balances in any number of defined currencies. The General Ledger Trial Balance (GLTBAL) report provides output in the currencies of the balances. However, the General Ledger Balance Sheet (GLBSHEET) report converts these currencies to the system base currency and provides output in this currency by default. There are a number of run-time options available with the Balance sheet reports, for a full description of these options and their usage see the *Core On-Demand Reports Guide*.

Totals on Income Statements and Balance Sheets

There are four levels of total that can be set up for a report (if a report does not utilise all these levels or if a level has a special use, this is indicated in the report description in the *Core On-Demand Reports Guide*), The method of totalling amounts is normally as follows:

- Type 0. If a line on the report is not to include any totalling, then set all the Total indicators off. This is normally done when you are printing information for a single general ledger account or if you are printing a line of text.
- Type 1. If a line on the report is to total all the entries of Type 0 between it and the previous Type 1 entry, then set the Total 1 indicator on but set all the other Total indicators off. This is normally done when you are grouping general ledger accounts by type (such as miscellaneous expense) and want to print totals for that grouping.
- Type 2. If a line on the report is to total all the entries of Type 1 between it and the previous Type 2 entry, then set the Total 2 indicator on but set all the other Total indicators off. This is normally done when you have used Type 1 as a sub-grouping of general ledger accounts by type (such as miscellaneous expense) and want to print totals for a grouping (such as expenses).

- Type 3. If a line on the report is to total all the entries of Type 2 between it and the previous Type 3 entry, then set the Total 3 indicator on but set all the other Total indicators off. This is normally done when you have used Types 1 and 2 as sub-groupings of general ledger accounts by type (such as miscellaneous expenses and expenses respectively) and want to print totals for a higher grouping (such as debits).
- Type 4. If a line on the report is to total all the entries of Type 3 between it and the previous Type 4 entry, then set the Total 4 indicator on but set all the other Total indicators off. This is normally used to produce a grand total of all the entries on a report.

The above paragraphs explain the general principal of totalling, but the following features are also available:

- You can produce a summary style report in which details of the individual general ledger accounts are not printed. To add details of a general ledger account (or accounts) into a total without printing details of the account, you:
  - Set up the total line in the normal manner
  - Set up an entry for the general ledger account using the same line number as the total line. Ensure that all the Total indicators are set off for the general ledger account entry.
- You can make a total line print out more than one type of total. For example, if you set up a total line with both the Total 1 and Total 2 indicators switched on, then the report will print a Type 1 total followed by a Type 2 total. The same rules will apply to the entries included in these totals as would apply to two separate total line entries (see above).

Procedure for Income Statement or Balance Sheet Set Up

The following procedure is recommended for setting up a balance sheet (the same procedure applies to an income statement, see the report definition in the *Core On-Demand Reports Guide* for any details specific to the report):

1. Sketch out the layout of the balance sheet you are designing or copy an existing one.
2. Number each line on the sheet including all titles, unused blank lines, lines with account details and totals. Leave gaps in the numbering sequence (this enables you to insert additional lines at a later date.)
3. Select each line that contains a header narrative but no.
4. List all the account numbers that contribute to each line total.
5. Decide where you want to print subtotals and totals. On the General Ledger Balance Sheet (GLBSHEET) report up to three total or subtotal columns are available for each balance sheet; for the General Ledger Trial Balance (GLTBAL) report the equivalent number of columns is four. Using the “Total 1” to “Total 4” fields you can choose to:
   – Print the accumulated total and reset the total to zero
   – Accumulate the total but not print it
   – Leave the totals blank for a header narrative line. Blank totals may also be used to test the layout of a report

   See Section 3, “Definition of Field Names” for more descriptions of the 'Total' fields

6. Decide where you want page throws to occur (for example at the end of major sections).
7. Enter the information you have recorded in the previous steps using the Trial Balance/Balance Sheet (TBBSM) screen. If a number of accounts contribute to the same line, enter each account on a separate screen, using the same line number.

Use the Trial Balance/Balance Sheet Inquiry (TBBSI) screen to review the information you have entered.

Trial Balance/Balance Sheet (TBBSM)

This screen is used to enter the layout parameters for the income statements and balance sheets. For a list of the reports for which layouts can be defined see 'Income Statements and Balance Sheets'.

You use the “Report Number” and “Report Indicator” fields to identify the report that you are defining. The “Line Number” field is used to identify the line within the report. The remaining fields are used to define the content of the line.

- By leaving the “GL Account Number” field blank, you can define the narrative and any totals that will appear on the line. The General Ledger Account Number and Narrative fields cannot be entered at the same time.
- The Totals and Page Throw fields are activated only for a line with Narrative.
- By specifying a general ledger account number, you can either:
  - Print details of the general ledger account on this line of the report, or
  - If you have already defined a total entry for this line, include details of the general ledger account in the totals that appear on the line. In this case details of the individual general ledger account will not be printed.
- The General Ledger Account Number and Narrative fields cannot both be entered at the same time.
- The Totals and the Page Throw fields will be activated only for a line with a Narrative.

For further details of creating a balance sheet, see “Income Statements and Balance Sheets”, “Totals on Income Statements and Balance Sheets” and “Procedure for Income Statement or Balance Sheet Set Up” earlier in this section.

The following figure shows an example of the Trial Balance/Balance Sheet screen.

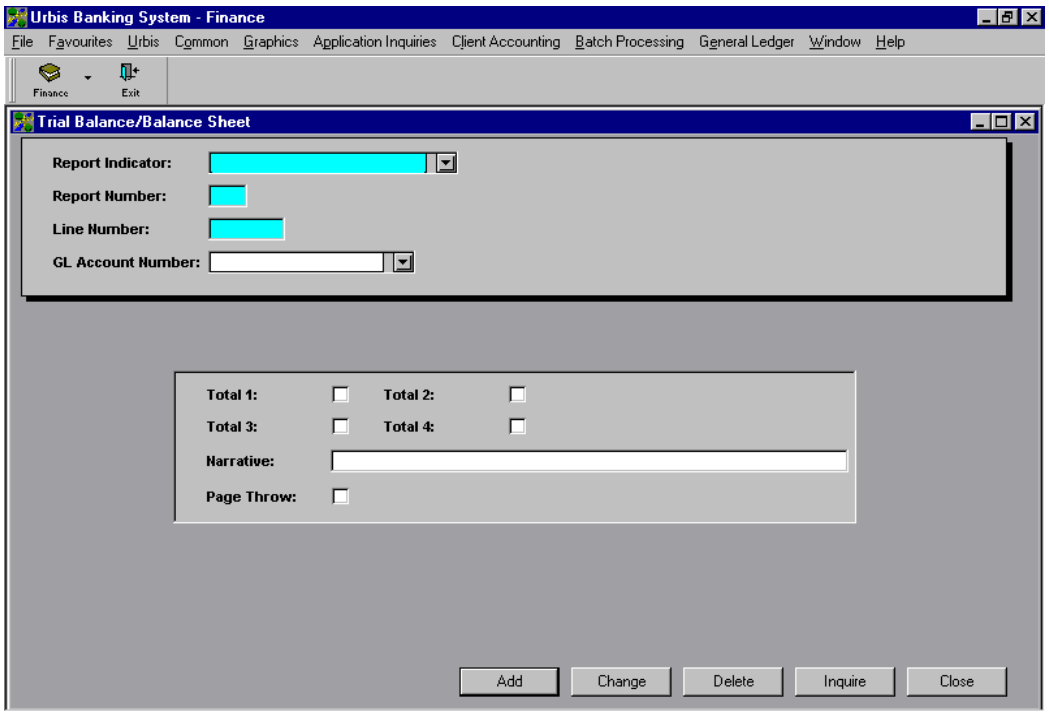

Figure 2–34. Trial Balance/Balance Sheet screen

Trial Balance/Balance Sheet Inquiry (TBBSI)

This inquiry shows the parameters that have been set up to define one layout of the trial balance or balance sheet. You use the “Report Indicator” field to choose the type of report (such as Balance Sheet) for which you want to view parameters. This indicator is set up on the Trial Balance/Balance Sheet (TBBSM) screen.

Up to nine different layouts are available. You specify the layout you require by entering 1-9 in the Report Number field. The Start Line Number field enables you to select the number of the line from which you wish the inquiry to begin.

An example of this inquiry screen is given in the following figure:

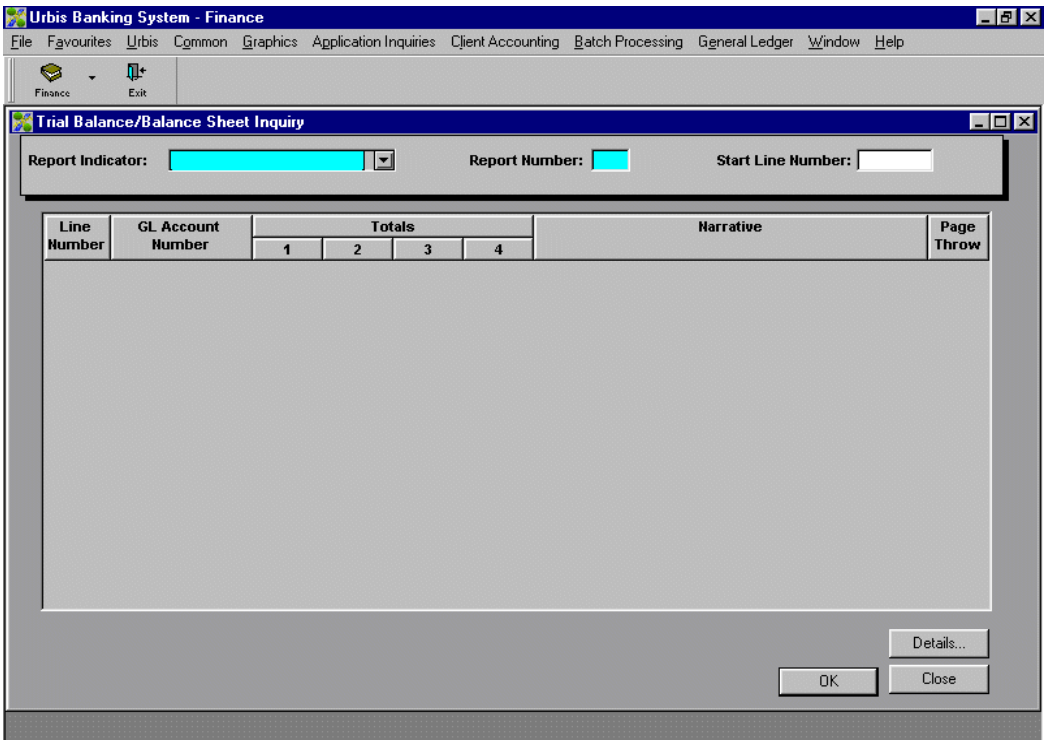

Figure 2–35. Trial Balance/Balance Sheet Inquiry screen

Balance Sheet Rule Off Dates (GLROM)

A balance sheet is usually ruled off after the end of an accounting period when the books are fully reconciled. The effect is to prevent any further changes to the balance sheet for the accounting period.

The Balance Sheet Rule Off Dates (GLROM) screen is used to set up the initial balance sheet rule off dates and to update the balance sheet rule off date for an accounting period. Postings can only be back valued up to and including the balance sheet rule off date currently in use.

For example, if you want to close the April accounting period, then you set the “Current Rule Off Date” field to April 30th. The actual date on which you change the rule off date is at your discretion, but it must be after April 30th. As soon as you set the rule off date for the period, no more back-valued postings or adjustments will be accepted for that period.

The original balance sheet rule off dates must be set up using the Balance Sheet Rule Off Dates (GLROM) screen before installation has been completed. To achieve this, switch 'on' the “Installation Complete” field.

After adding the initial rule off dates and completing other installation tasks, the Installation Complete indicator can be set on the System Parameters (SPMTR) screen (see the *Guide to Setting Up*). Users of the Retail system should see System Parameters (SPMTR) in the *Guide to Setting Up the Retail System*.

Updating of rule off dates can be done at any time provided the initial rule off dates were set up before installation was completed.

The Balance Sheet Rule Off Dates (GLROM) screen has an inquiry section where the previous and current rule off dates are displayed, as well as an update section where the rule off dates can be amended.

If you change the “Previous Rule Off Date”, you must also change the “Current Rule Off Date”.

If you are only changing the “Current Rule Off Date”, it must be greater than the “Previous Rule Off Date”.

If both dates are being changed:

- The “Previous Rule Off Date” must be set to the “Current Rule Off Date” as shown in the inquiry section
- The “Current Rule Off Date” entered must be greater than the “Previous Rule Off Date” entered.

The following figure shows an example of the Balance Sheet Rule Off Date Screen.

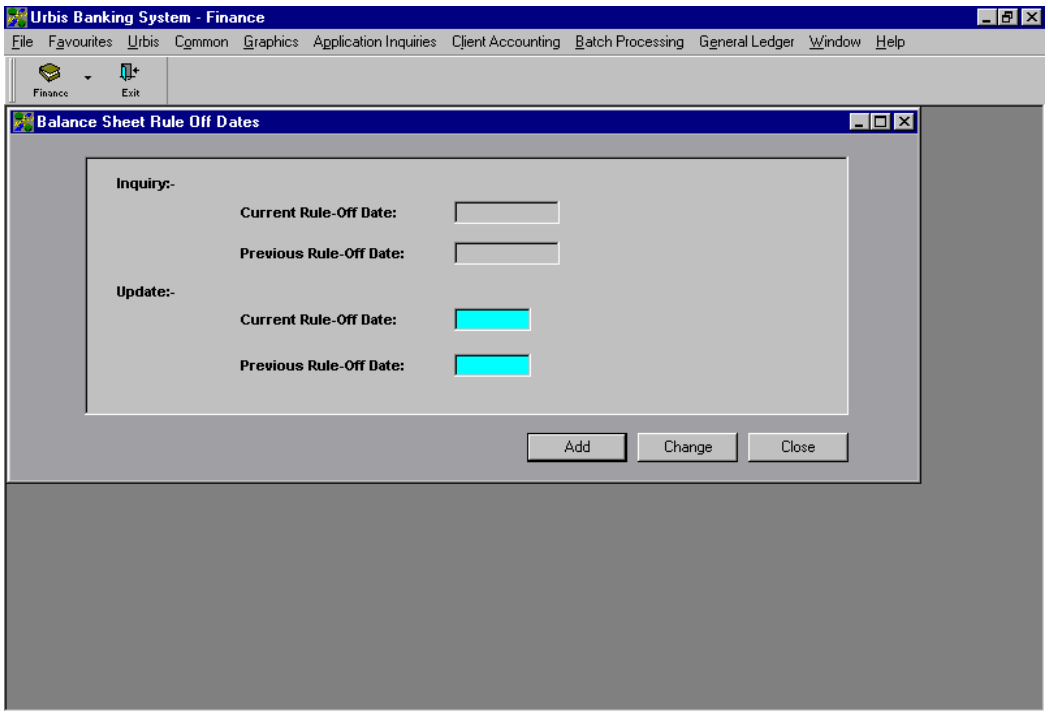

Figure 2–36. Balance Sheet Rule Off Date screen

GL Statutory Reports Information Maintenance (GLSRM)

Use this screen to record additional information on General Ledger accounts for Statutory Reporting purposes. All GL accounts that are required to be reported in statutory returns must be set-up on this screen, accounts not defined on this screen will not be included in the rFRAME extract. From this screen you can maintain information for a GL account or accounts in various ways:

- For a GL account for a specified accounting centre and currency. Enter the Accounting Centre and Account Currency fields.
- For a GL account in all currencies existing in a specified accounting centre. Enter the Accounting Centre field and enter "Y" in the All Currencies field
- For a GL account in all accounting centres for a specified currency. Enter the Account Currency field and enter "Y" in the All Centres field.
- For a GL account existing in all accounting centres for all currencies. Enter "Y" in both the All Centres and All Currencies fields.

When you have selected a general ledger account, or set of accounts to define statutory reporting parameters for, you can use this screen to enter those parameters. Not all of the fields are relevant to all accounts.

Some of the fields on this screen contain standard lists of codes relating to what the account is for. These codes are provided by the central bank, and are stored in general purpose narrative tables. For example, the Income / Expense Type field contains data from the general purpose narrative table type IE, and shows what type of income or expense an internal account holds. You can inquire on the contents of a General Purpose Narrative (GNARR) table by using the General Purpose Narrative Inquiry (GNARI) screen. General purpose narrative tables are described in the *Guide to Setting Up* or the *Guide to Setting Up the Retail System*.

The following fields contain standard information supplied by the central bank, and stored as general purpose narrative tables:

- Assets - General purpose narrative table type GA
- Capital Type Code - General purpose narrative table type GC
- Income / Expense Type - General purpose narrative table type IE
- Income / Expense Sub Type - General purpose narrative table type SB
- Internal Account Type - General purpose narrative table type IT
- Institutional Sector Code - General purpose narrative table type IS
- Investment Type – General purpose narrative table type IV
- Provision Code - General purpose narrative table type GP
- Provision Customer Type - General purpose narrative table type GX
- Suspense Customer Type - General purpose narrative table type SU

The following figure shows an example of the GL Statutory Information Maintenance (GLSRM) screen.

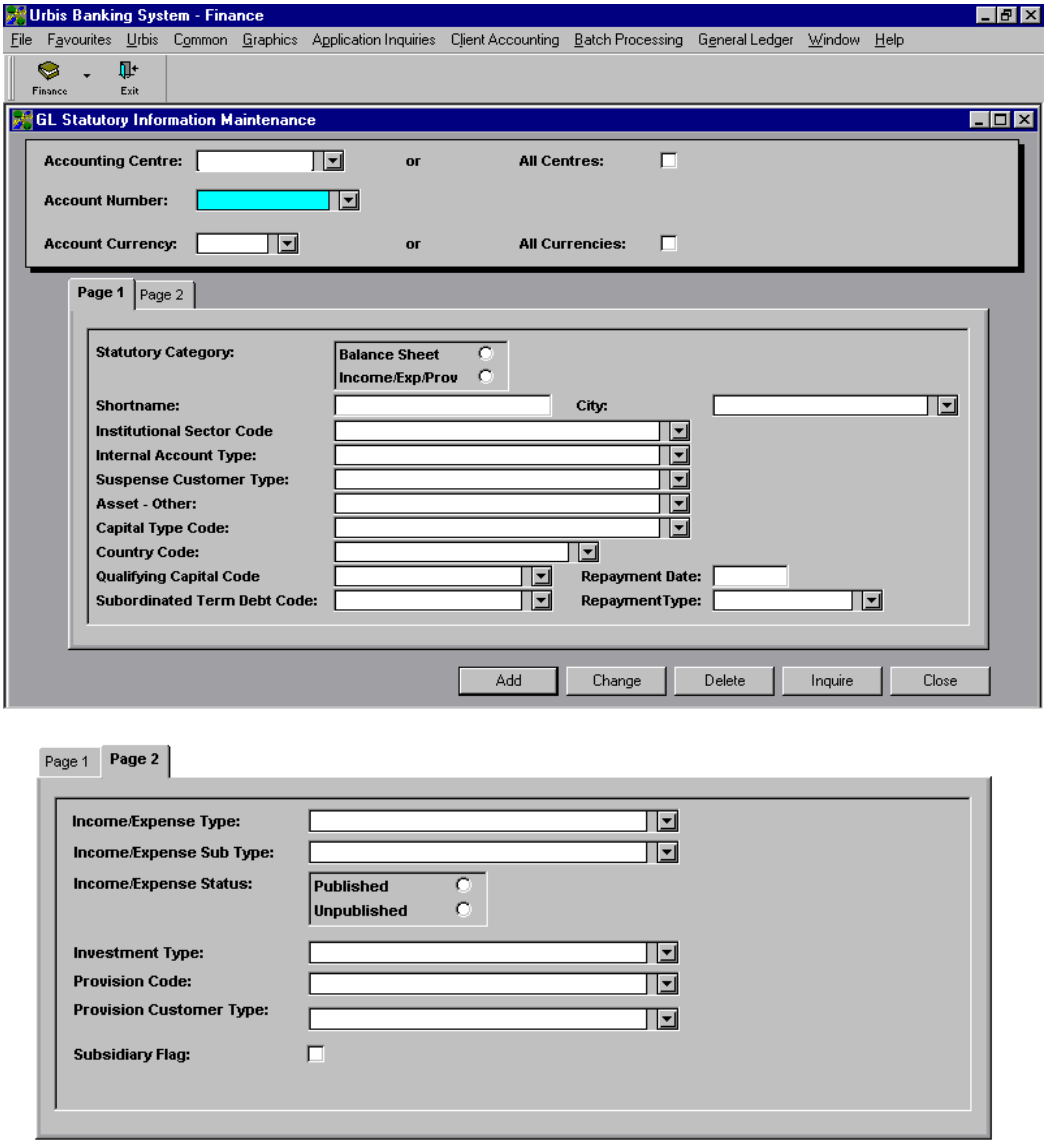

Figure 2-37. GL Statutory Information Maintenance screen

Reports

Urbis contains various reports to help in maintaining general ledger accounts, and inquiring on their details. Here is a list of reports you may find useful, you can find out further information in *Core On-Demand Reports Guide*:

- AVGBAL - Average Balance Sheet
  this report produces a balance sheet showing the average balance for general ledger accounts over a defined period.
- GLACDTL - General Ledger Account Details
  This report supplies extensive details for each general ledger account held by the bank.
- GLACLST - General Ledger Accounts list
  This report lists all general ledger accounts in the system in the following order: Accounting Centre, Currency, and Account Number.
- GLACTURN - General Ledger Account Turnover
  This report is produced at the end of each accounting period to show the credit and debit movements (turnover) on each account.
- GLADMLST - Account Definitions Table Report
  This report lists the details of the General Ledger Account Definition (GLADM) table.
- GLBOOKING - General Ledger Postings Journal
  This report lists all postings (whether entered manually or generated by the system), to general ledger real or memo accounts.
- GLBSHEET - General Ledger Balance Sheet
  This report provides information on; Individual Accounting Centre Currency Conversion, Consolidated Currency Conversion, Individual Accounting Centre Balance Sheet, and Consolidated Balance Sheet.
- GLDFLST - General Ledger Default Masters List
  This report prints details of all the general ledger masters in order of accounting centre.
- GLMAMLST - General Ledger Masters List
  This report also provides details of the general ledger masters, but with different information presented.
- GLJOURNAL - General Ledger Postings Journal
  This report lists all postings (whether entered manually or generated automatically) to general ledger (real or memo) accounts.
- GLTBAL - General Ledger Trial Balance
  This report lists the real and memorandum general ledger accounts. Each account is reported on a separate line. A trial balance is also produced for each currency, with control totals at the end of each currency section.
- GLTRNLST - General Ledger Account Postings List
  This report provides details of the postings made to each general ledger account during a specified period.
- INCOMESTMT - Income Statement
  This report produces individual or consolidated statements for a defined period in a base currency.

- STMNTCON - Statement of Condition
  This report produces a summary statement of the postings made to general ledger accounts for a defined period.
- STMNTINC - Income Statement (1)
  This report produces a summary statement of the postings made to general ledger accounts for a defined period.

Section 3
Definition of Field Names

Introduction

This section provides a definition of all the field names on General Ledger data entry and inquiry screens. The fields are listed alphabetically according to their full name and details of valid entries are given.

If the field is prefilled with a value on the screen, or defaults to a value if left blank, these values are also given.

Many of the codes and mnemonics given in this section may be changed when the system is installed at your bank.

Table 3–1. Definition of Field Names

Field	Definition
Account	The number of an account to which a posting is made.
Account Category	The type of general ledger account being specified. The following categories apply: **Backing (B)** Backing general ledger account for general ledger postings associated with client accounts. **Control (C)** Control general ledger account for general ledger postings arising through the accounting models. This type of account can be changed to Standard. **Standard (S)** The account category used for entering manual debits and credits.
Account Currency	The currency of the account. If “Automatic Account Generation” is switched 'On' on the General Ledger Account Definition (GLADM) screen, the system will create accounts in other currencies if a posting requires it. This is regardless of the currency that is set on the General Ledger Account Details (GLSTM) screen.
Account Description	The longname of the account.
Account Name	The longname of the account. This is used for reporting.

Field	Definition
Account Number	This is a number assigned by you on the General Ledger Account Definition (GLADM) screen to represent a general ledger account. The number can be composed of a mixture of letters and numbers.
Account Status	The status of the account.
Account Type	This indicates one of the following account types: • Real (R) (this is the default) • Memorandum (M)
Accounting Centre	This is the identifier of the Accounting Centre as set up on the Accounting Centres Maintenance (ACNTM) screen. Accounting Centre consists of a Sector Code, Sub-Sector Code and Profit Centre Code. These codes are held on the General Narratives Table (GNARR), table types, SE, SS and PF respectively. For posting screens, the accounting centre is prefilled with the accounting centre entered on the Batch Header (BHEAD) screen. For General Ledger Account Batches, this is the identifier of the accounting centre from which a batch originates. On the General Ledger Account Details (GLSTM) screen, you must enter either an Accounting Centre or switch 'On' the All Accounting Centres indicator. On the GL Bulk Adjustments (GLADJ) screen, this is the accounting centre of the account to which the posting is being made. On the General Ledger Accounts Inquiry (GLSTI) screen, enter the accounting centre for which you want view the general ledger accounts. On the General Ledger Account Summary (GLASI), General Ledger Account Details (GLACI) and Account History Inquiry (HISTA) screens, enter the accounting centre whose general ledger account you want to view. On the GL Statutory Reports Information Maintenance (GLSRM) screen, this is the accounting centre of the account for which you are creating statutory report parameters. On the Cash Wastes (CASHW) screen, this is the accounting centre for the credit and debit cash postings to client accounts and to general ledger accounts.

Field	Definition
Agreement Type	This applies to Forward Rate Agreement contract types only. It indicates whether the contracts for which the default general ledger master is being set up are bought or sold. This affects the method by which the accounting of profit and loss is measured. Traded deals are marked to market up the settlement date whereas hedged deals are accrued over the notional contract period. The following values are allowed: • Bought (B) • Sold (S)
All Accounting Centres	On the GL Account Details (GLSTM) screen, this indicates whether or not you want a general ledger account to be created for all accounting centres using the definition set up on the General Ledger Account Definition (GLADM) screen. • Switch 'On' this field to create the account for all accounting centres. • Switch 'Off' this field to create the account for the accounting centre entered in the 'Accounting Centre' field. When the “All Accounting Centres” option is selected, accounts are created immediately. On the GL Statutory Information Maintenance (GLSRM) screen, switch 'On' this field if you want statutory reports to be created for all accounting centres related to the account. Data is extracted from Urbis and used to produce statutory reports by the rFrame interface.
All Currencies	On the GL Account Details (GLSTM) screen, this indicates whether or not you want a general ledger account to be created for all currencies using the definition set up on the General Ledger Account Definition (GLADM) screen. • Switch 'On' this field to create the account for all currencies • Switch 'Off' this field to create the account for the currency entered in the 'Account Currency' field When the “All Currencies” option is selected, accounts are created immediately. On the GL Statutory Information Maintenance (GLSTM) screen, switch 'On' this field if you want statutory reports to be created for all currencies related to the account. Data is extracted from Urbis and used to produce statutory reports by the rFrame interface.
Amount	The amount of the posting.
Asset - Other	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type GA. This field only needs to be entered if the Internal Account Type is set to Property (number 92).

Field	Definition
Associated Contract Types	The mnemonics of up to three contract types associated with the general ledger master. The contract type mnemonics are blueprint parameters. For non-retail banking client accounts, the backing general ledger account must always be grouped with a general ledger master on whom one of the associated contract types is defined as Client Account (CAAC).
Authorise	On the Batch Authorisation (CABAA) screen, switch 'On' this field to authorise the selected batches.
Authorised By	This is the usercode of the User who authorised the updates.
Automatic Account Generation	This indicates whether or not you want general ledger accounts to be automatically created using the account definition set up on the General Ledger Account Definition (GLADM) screen. If this indicator switched 'On', an account will be created when an event causes a posting to be made to a specified account, for a currency or an accounting centre, for which the account does not already exist. On - Yes Off - No ***Note:*** *This function is only relevant if the 'All Accounting Centres' and 'All Currencies' fields on the General Ledger Account Details (GLSTM) screen are switched 'Off'. If both these are switched 'On' then all accounts will have been created already.*
Batch End	On the Cash Wastes (CASHW) screen, if you have reached the last line of the screen and wish to complete the batch, click on the "**Batch End**" button. Otherwise it is assumed that you wish to make further entries, on the next screen. If you have not reached the last line, but have completed the batch, you do not need to use the Batch End function.
Batch Number	This number is automatically assigned by the system when opening a new batch, entering bulk adjustments, or entering cash wastes.
Batch Priority	This field enables you to select a priority value between 1 to 9. If the priority is not entered by the user, the system will assign default value for the corresponding batch type (A) as defined by user on the new default batch priority maintenance static table, BP. ***Note***: *The highest priority value is 1 and the least priority value is 9. The default value is 5.*

Field	Definition
Batch Status	This is the status of the batch. Different batch statuses may be available on your system depending on whether batch authorisation is being used. It is possible to have one or two levels of authorisation. This is determined by the blueprint parameters BP-ATH-REQ-BATCH and BP-DUAL-ATH. The following is a complete list of possible statuses: Awaiting Authorisation (A) Open (O) Checked (K) Closed by System (S) Closed by User (C) Closed Reconciled (R) In addition, when searching by batch status on the Batch Inquiry (BTCHI) screen, you can search for all statuses by selecting the "All" option from the drop down list on the GUI; or entering a space in the text system.
Batch Type	The type of batch being inquired on. This can be one of the following: Client Cash Waste GL
Book Balance	The total balance posted to an account, including cheques or postings that have not yet come to value.
Book Balance as of	The total balance posted to the account, including cheques in clearing and postings that have not yet come to value. This balance is as of the date shown.
Bought Accounting Centre	The mnemonic of the foreign exchange accounting centre from which you are buying your currency.
Capital Type Code	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type GC. This field only needs to be entered if the Internal Account Type is set to Capital (number 50).
Category	On the General Ledger Account Inquiry (GLACI) screen, this indicates the type of general ledger account being inquired upon. The following categories can apply: • Backing general ledger account for general ledger postings associated with client accounts. This is only displayed for client accounts that have a backing general ledger account created on the Client Account Static Details (WACCM) screen. • Control general ledger account for general ledger postings arising through the accounting models. • Standard general ledger account for general ledger postings arising either through accounting models or directly through postings screens, for example Cash Wastes (CASHW).

Field	Definition
Charge	A code identifying the charge associated with the posting. The codes are set up on the Charge Codes Maintenance (CACCM) screen.
Charge Amount/Currency	This covers the following charge details: • The amount of the charge associated with the customer transfer • The currency of the charge
Charge Type	On the Standing Orders Input (SOSTM) screen, this indicates which party is to bear the cost of charges associated with the standing order. The following values are allowed: • Beneficiary (BEN) • Bank (OUR)
City	This field should be entered in combination with the Shortname field to identify one of your clients. This information is used by the rFRAME interface to produce statutory reports.
Client	The name of the client account to which the posting was made.
Client Type	On the Default GL Masters Inquiry (GLDFI), this is an identifier showing the type of client. This is set up on the General Purpose Narratives (GNARR) table, type CL.
Closed By	The Usercode of the person closing the displayed batch
Contract Type	The mnemonic of the type of contract. These mnemonics are Blueprint parameters (see “Global Contract Type Narratives” in the *Guide to Setting Up*) that must correspond to the mnemonics set up on the General Purpose Narratives (GNARR) table, type CN.
Country Code	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It gives the country code your system uses for the country of the central bank. The mnemoic of the country is set up on the Countries (CNTRY) screen.
CR Average Balance Period-to-date	The average credit balance of the account in the period-to-date.
CR Turnover Period to Date	The average credit turnover on the account in the period-to-date.
Create/Amend MT100	On the Standing Orders Input (SOSTM) screen, this field shows if you want to create or delete an MT100 message for this clean payment. The following values are applicable: • Yes (Y) – Create/Change MT100 • No (N) – Do not create or change MT100 • Delete (D) – Delete the MT100

Field	Definition
Create/Amend MT202	On the Standing Orders Input (SOSTM) screen, this field shows if you want to create or delete an MT202 message for this clean payment. The following values are applicable: • Yes (Y) – Create/Change MT100 • No (N) – Do not create or change MT100 • Delete (D) – Delete the MT100
Credit Account Identifier	The Accounting Centre mnemonic, account or general ledger number and currency mnemonic, which together are used to identify the credit account.
Credit Account Number	The number of the general ledger account into which transfer payments are made. As part of this identifier, you must make an entry in the adjacent “Currency” field to indicate the currency to be used by the credit account. This can be different from the currency of the debit account. You must always enter the Accounting Centre where the Credit Account is held. See ‘Credit Accounting Centre’.
Credit Accounting Centre	The mnemonic of the accounting centre where the credit account is held.
Cross Currency Exchange Rate	This indicates which type of exchange rate is to be used, and can be either: • Mid Market (MID) • Market Rate (MKT) Exchange rates are defined on the Exchange Rates (EXCHM) table. Spot and forward buy and sell rates (counter) are specified on this table together with a market buy and sell rate and a mid-market rate for today and last night.
Currency	The currency of an account or the currency in which a posting is made. Currency mnemonics are defined on the Currencies Table (CCYS). On the Standing Order Input (SOSTM) screen, this is the currency to be used by the credit or debit accounts.
Currency Conversion Indicator	This field controls whether the account is to be converted from its existing currency into euros. • Switch 'On' this field if the account will be converted to euros in the next overnight run. • Switch 'Off' this field if the account will not be converted to euros in the next overnight run.
Currency of Transfer	The currency in which the transfer is to take place. This is relevant to cross currency standing orders that involve a fixed credit amount only. Currency mnemonics are defined on the Currencies Table (CCYS).
Current Rule Off Date	The date that defines the day after which changes can no longer be made to the Balance Sheet. This should be updated at the end of each accounting period so that you can control the length of time, after the period end, during which postings can be made to update the balance sheet.

Field	Definition
Date	The date of the posting.
Date Entered	The date that the batch was entered.
Debit Account Number	For standing orders this is the number of the general ledger account from which transfer payments are made. As part of this identifier, the adjacent “Currency” field indicates the currency to be used by the debit account. You must always enter the Accounting Centre where the Debit Account is held. See ‘Debit Accounting Centre’.
Debit Accounting Centre	The mnemonic of the accounting centre where the debit account is held.
Default GL Master Number	The number of the general ledger master that is the default ledger category for the accounting centre and internal client type specified.
Delete	Select this field if the unreconciled batch is to be deleted.
DR Average Balance Period-to-date	The average debit balance of the account in the period-to-date.
DR Turnover Period to Date	The average debit turnover on the account in the period-to-date.
EMU Conversion Date	The date of conversion to the EMU.
Entry Complete	When you have finished entering the standing order details, you must confirm that it is complete. To do this, switch 'On' this field and click the **Ok** button.
Exchange Rate Group	For foreign currency standing orders, enter the exchange rate group for the currency.
Extended Narrative	The first line of narrative, if extended narratives are used, will have to be entered on actual batch/clean payment/standing order screen. Link is available from these screens to a extended narrative screen, where the extended narrative are maintained (added/changed/deleted/inquired). The first line of the Narrative is displayed but will be non-modifiable via this screen. The five extra lines of narrative will be referred to as ‘Extended Narrative’. Unless the system level blueprint parameter (BP-EXTD-NARR) is set to ‘YES’, the extended narrative will be prohibited and the user will only be allowed to use single line narrative. If extended narratives are used, the posting narrative field will allow the user to enter a maximum of 34 characters (or 26 characters when the last 8 characters of the narrative are reserved for the batch number). ***Note:*** *The extended narratives will be allowed only if narrative (and not narrative code) is selected on add/change screens. The extended narrative is not applicable to client SWIFT statements.*
Final Event Date	The date of the scheduled final event or completion for a standing order.

Field	Definition
First Payment Date	The date on which the first standing order payment is to be made.
FX Revaluation	This indicates whether or not the account should be revalued against prevailing exchange rates during overnight processing. • Switch 'On' this field if the account is to be revalued. • Switch 'Off' this field if the account is not to be revalued.
GL Account Number	The number of the account that you are defining, closing or to which postings are made. Also the number of the general ledger account appearing on the income statement or balance sheet. The number assigned by you on the General Ledger Account Definition (GLADM) screen. The number can be composed of a mixture of letters and numbers. On the General Ledger Accounts Inquiry (GLSTI) screen, you can enter an account number to start the list of accounts from a particular point. On the General Ledger Account Summary (GLASI) and General Ledger Account Details (GLACI) screens, enter the number of the account to be displayed.
GL Contra Account Number	The number of the general ledger contra account for a posting.
GL Master	On the Default GL Masters Inquiry (GLDFI) screen, the number of the general ledger master associated with the accounting centre or product.
GL Master Number	The number of the general ledger master associated with the general ledger account.
Header Accounting Centre	The accounting centre against which cross-accounting centre postings are to be recorded.
Holiday Method	This comprises two fields. The first identifies the method that the system uses to determine the settlement event date, if the system generated event date falls on a holiday in the countries indicated by the value in the second field. The first field indicates one of the following: **Following (F)** The system settles the amount on the next available day. **Modified (M)** The system settles the amount on the next available day. If this falls in the following month, the system will search for the first available day prior to the end of the month. **Previous (P)** The system settles the amount on the first available previous day. **None (N)** The system will settle on the event day, even if it is a holiday. The second field contains a value defined on the Country Check Codes table (CNCHK) representing the currencies to be checked for holidays for each contract event.

Field	Definition
Holiday Override	This comprises two fields. The first indicates whether an event on the contract can occur on a holiday: • Switch 'On' this field if events can occur on holidays • Switch 'Off' this field if events cannot occur on holidays. The second field contains a value defined on the Country Check Codes table (CNCHK) representing the currencies to be checked for holidays for each contract event.
Income/Expense Status	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This field only needs to be entered if the Statutory Category field is set to Income/Expense. Valid options are: Published (P) Unpublished (U) *Note: If the Income/Expense type field is set to 50 (representing Unpublished Profit/Loss) then this field must be set to U.*
Income/Expense Sub type	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type SB. This field only needs to be entered if the Statutory Category field is set to Income/Expense.
Income/Expense Type	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type IE.
Input Date	For the Postings Inquiry by Account (POSTI), Postings Inquiry by Number (POSTN) and the Statement Inquiry by Date (STMTD) screens this is the date upon which the posting was entered.
Institutional Sector Code	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type IS. This field only needs to be entered if the Account Category is set to Income/Expenses (Type I)
Interest Conditions	This field is not relevant to general ledger accounts.
Internal Account Type	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type IA. On the GLSRM screen this field only needs to be entered if the Statutory Category field is set to Balance Sheet.

Field	Definition
Internal Client Type Specific Type Range of Types	Either enter the type of client, or two client types, creating a range of client types. These are defined on the General Purpose Narratives (GNARR) Table, type IC. ***Note:*** *If you are setting up a default general ledger master for a contract type that represents an internal deal type, you must enter a 'Specific Type' of 99.*
Investment Type	This field is used only in loans administration. It is the type of BSR 97 investment
Is Ordering Party a Bank?	For a standing order, this field should be set to "on" if the party placing the standing order is a bank.
Last Event Amount Credit	The amount credited to the Credit Account by the last event.
Last Event Amount Debit	The amount debited from the Debit Account by the last event.
Last Event Date	The date of the last event for the standing order.
Last Payment Date	This field is not relevant for general ledger standing orders.
Last Update By	On the Standing Orders Input (SOSTM) screen, this shows the usercode of the user who last updated the record.
Last Updated	On the Standing Orders Input (SOSTM) screen, this shows the date that the record was last updated.
Last Posting Input Date	The last date on which a posting was made for this account.
Line Number	The sequence number of the line on the income statement or balance sheet.
Longname	The longname of the general ledger master as it is printed on reports.
Master Number	The number of a general ledger master to which an account is linked.
Memo Error Suspense Account	The number of the memorandum suspense account. This must be set up in your general ledger.
MT100 Exists	On the Standing Orders Input (SOSTM) screen, select this field if the MT100 message for the transfer exists.
MT202 Exists	On the Standing Orders Input (SOSTM) screen, select this field if the MT202 message for the transfer exists.
Name	On the General Ledger Accounts Definition Inquiry (GLADI), the General Ledger Accounts Inquiry (GLSTI), General Ledger Account Summary (GLASI) and the General Ledger Account Inquiry (GLACI) screens, this is the full name of the account.

Field	Definition
Narrative	On the Trial Balance/Balance Sheet (TBBSM) screen, the text to be printed for the line on the income statement or balance sheet. On the Cash Wastes (CASHW) screen, GL Bulk Adjustments (GLADJ) screen, GL Book Adjustment Debit and Credit (GLACR and GLADR) screens and the General Ledger Debit and Credit (GLDR and GLCR) screens, this is a narrative to be printed on a statement or the advices for a transaction. If you enter a Narrative you cannot enter a Narrative Code.
Narrative Code	A code for a standard narrative to be printed on a statement for a transaction. If you enter a Narrative Code you cannot enter a Narrative. These codes are set up on the General Purpose Narratives Tables (table type ST).
Next Event Date	The date of the next event for the standing order.
Next Input Date	Enter the date to produce the inquiry from the entered date.
Next Value Date	Enter the value date required to display the postings from the entered date.
Nostro Name	This field is not relevant for general ledger standing orders.
Number of Events Since Start	The number of standing order events since the standing order first payment date.
Number of Items	The number of credit or debit items in a batch.
Opened By	This is the usercode of the user who started the batch.
Original Currency	If the transaction is in euros, and the original currency of the account was different from this, enter the original currency in this field. This field is for documentary purposes only
Page Throw	This indicates whether or not a new page will be started after this line. • Switch 'On' this field if a new page will be started. • Switch 'Off' this field if a new page is not collected.
Pay Nostro	This field is not relevant to general ledger standing orders.
Payment Amount	This field is used to define the amount of a standing order. It must be used in conjunction with the payment type (refer to "Payment Type" field) to cater for the various ways in which the amount to be transferred is derived.
Payment Frequency	A code indicating the frequency at which payments are to be made. These are defined on the General Purpose Narratives Table (table type FR).

Field	Definition
Payment Type	This is the type of standing order: • **Fixed amount (AM)** A stated fixed amount • **Full balance (FL)** The balance in full • **Minimum balance (MN)** The amount required to "top up" an account's balance to a stated minimum amount • **Maximum balance (MX)** The balance in full, up to a stated maximum amount • **Above Maximum balance (OA)** The balance above a maximum amount
Payments Remaining	The number of payments outstanding on a standing order.
Posting Date	The date of the book adjustment posting.
Posting Narrative	The narrative text to be used when posting the standing order transactions.
Posting Type	The type of accounts to which the postings in the batch are being made: • Client Account (C) • General Ledger (G)
Previous Rule Off Date	The date that defines the day after which changes can no longer be made to the previous Balance Sheet. This is updated at the end of the current accounting period. See also "Current Rule Off Date".
Product Type	On the General Ledger Default Master Maintenance (GLDFM) screen, this mnemonic represents a product. The mnemonic may be either a Product Type, as set up on the Product Types Maintenance (PRTPM), or an Instrument Code for Futures and Options as set up on the Futures/Options Products table (FTPRM).
Provision Code	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type GP. This field only needs to be entered if the Income/Expense field is set to '00' (Not applicable).
Provision Customer Type	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type GX. This field only needs to be entered if the Provision Code field is set to Bad/Doubtful Debt - Specific Provision (number 11)

Field	Definition
Qualifying Capital Code	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It identifies whether the item can be defined as qualifying capital, for capital adequacy purposes. Valid values for this field are: • Tier 1 Qualifying Capital (1) • Tier 2 Qualifying Capital (2) • Qualifying Capital (3) Leaving this field blank refers to any form of capital not listed above. This field only needs to be entered if the Capital Type Code is set to Subordinated Loan or Stock (Types D or N), or if the Internal Account Type is set to Minority Interests (number 61).
Real Error Suspense Account	On the General Ledger Master (GLMAM) screen, this is the number of the real error suspense account.
Reconcile Batch	Indicates whether or not you want the batch to be reconciled: • Switch 'On' this field to reconcile the batch. • Switch 'Off' this field if the batch is not to be reconciled. Batches cannot be reconciled if the entered figures do not match the figures calculated by the system. If reconciled, batches cannot be changed.
Reference Number	A unique number assigned by the system that identifies an individual posting being made for a specified accounting centre. For standing orders this is the unique reference number that identifies the standing order.
Related Accounts 1 to 30	The numbers of up to 30 General Ledger accounts associated with the general ledger master.
Repayment Date	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This field only needs to be entered if the Capital Type Code is set to B, D, J, L or N. These codes are defined by your statutory authority.
Repayment Type	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. Valid values for this field are: • In full on maturity (F) • In instalments (I) Leaving this field blank means it is not applicable. This field only needs to be entered if the Capital Type Code is set to B, D, J, L or N. These codes are defined by your statutory authority.

Field	Definition
Report Indicator	This indicates the type of report as set up on the General Purpose Narrative (GNARR) table, type TB: Balance Sheet (B) Trial Balance Sheet (T) Average Balance Sheet (A) Statement of Condition (C) Income Statement (I)
Report Number	The number (1 to 9) identifying the format of the report. Nine layout records may be created for each type of report. (See also Report Indicator.)
Reversal Number	This is the posting number of the original posting that is to be reversed. Batch reversals can be made for client accounts, but not for general ledger accounts. See the *Clients and Accounts Administration Guide* for client account batch reversals.
S.W.I.F.T. Message Priority	This field contains the S.W.I.F.T. Priority of the message. For an exact definition, refer to the S.W.I.F.T. documentation.
Screen Name	The mnemonic of the screen.
Sequence	A number used to indicate the priority of a payment should an account require more than one standing order to be actioned on the same day.
Shortname	The shortname of the general ledger master. On the GL zStatutory Information Maintenance screen, this field contains information that will be sent to the rFrame interface for inclusion in a statutory report. Before entering this field, a valid Provision Code must be entered. This field only needs to be entered if the Account Category field is set to Income Expense (Type I).
Show Amount	Indicates whether the Account History Inquiry (HISTA) shows the account balance, interest accrual, or settled interest on the date shown. The following values are allowed: Balance (B) Accrual (A) Settled (S)
Show Euro Equivalent	Selecting this field when inquiring on an account will return the balance automatically converted into Euros. • Switch 'On' this field to view amounts in euros • Switch 'Off' this field to show amounts in the default currency. This is the default value. This field is only relevant to currencies participating in European monetary union, and in Phase 3B or 3C of the process.
Sold Accounting Centre	The mnemonic of the foreign exchange accounting centre to which you are selling your currency.

Field	Definition
Standing Order Type	This indicates a type of standing order. • CA to CA (CC) - Client Account to Client Account • CA to GL (CG) - Client Account to General Ledger • CA to external (EX) - Client Account to external third party account • GL to GL (GL) - General Ledger to General Ledger • GL to CA (GC) - General Ledger to Client Account • GL to external (GX) - General Ledger to external third party account
Start Account Number	On the GL Account Definition Inquiry (GLADI) screen, this is the point in the list of Account Numbers set up on the General Ledger Account Definition Maintenance (GLADM) screen from which you want the inquiry to begin.
Start Accounting Centre	This is the point in the list of Accounting Centres set up on the Accounting Centres Maintenance (ACNTM) screen from which you want the inquiry to start.
Start Batch Number	Enter the batch number that the inquiry display is to start from.
Start Client Type	This indicates where in the list of client types you wish the inquiry to begin. On the Default General Ledger Masters Inquiry (GLDFI), a client type is represented by a code set up on the General Purpose Narratives table (GNARR), type CL.
Start Line Number	This is the point in the list of balance sheet line numbers from which you want the inquiry to start.
Start Product Type	This shows where in the list of Product Types you wish the inquiry to start.
Start/End of Day	This indicates whether postings are to be applied at "Start of Day" or "End of Day" for the duration of the standing order: • Start of Day (S) • End of Day (E) ***Note:*** *This applies to Standing Orders that apply to non-retail banking client accounts and general ledger accounts only.*
Starting Date	The date from which you want the inquiry to start.
Statement Number	This field is not relevant to general ledger accounts.

Field	Definition
Status	On the Standing Order Input (SOSTM) screen, this indicates the status of the instruction: • **Unactioned** No payments have been made under the instruction • **Active** At least one payment has been made and the instruction is in use • **Expired** The Last Payment Date on an instruction has passed • **Cancelled** The Cancellation Date (if entered) has passed • **Deleted** The instruction has been deleted
Status Code	The status of an account: 0 Unopened 1 Active 2 Inactive 3 Suspended 4 Government suspension 5 Other suspension 6 Other suspension 7 Other suspension Codes 5 to 7 can be defined at installation. You may either select a status from the list or enter the numeric code. Users of the text based screens may only use the numeric codes. When recalling a screen, the following code may be displayed: 8 Closed For an add, the status code defaults to 0 (unopened) if left blank.
Statutory Category	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This field must be entered for all account types that must be reported on. This must be either; Balance Sheet (B) Income / Expense (I)

Field	Definition
Subordinated Term Debt Code	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. Valid values for this field are: • Convertible Subordinated Bond (B) • Subordinated Term Loan Capital (L) • Dated Preference Shares (P) This field only needs to be entered if the Capital Type Code is set to Unsecured subordinated Loan Capital (type D).
Subsidiary Flag	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This field indicates that the GL account represents an investment in a subsidiary of the reporting bank.
Suppress Client Advices	This field is not relevant to general ledger standing orders.
Suspense Customer Type	This field contains information that will be sent to the rFrame interface for inclusion in a statutory report. It is used to define characteristics of an account or accounts. This is set up on the General Purpose Table (GNARR), type SU. This field only needs to be entered if the Statutory Category field is set to Balance Sheet (B).
Total 1 to 4	This indicates whether the total is to be printed on the line of the income statement or balance sheet. To print the total and reset it to zero, switch 'On' this field. If you want the line to be a header line or print details of a GL Account number, switch 'Off' all the 'Total' indicators.
Total Amount	The total amount of a posting. The total may consist of several vouchers.
Total Amount of Debit Events Since Start	The total debit amount since the standing order first payment date.
Total Amount of Debit Events Year to Date	The total debit amount since the start of year.
Total Credit Amount	The total amount of credit postings in a batch.
Total Credit Items	The total number of credit items in a batch.
Total Debit Amount	The total amount of debit postings in a batch.
Total Debit Items	The total number of debit items in a batch.
Trade Type	This indicates whether the contract is Traded or Hedged, from your own standpoint: • Traded (T) • Hedged (H)

Field	Definition
Transfer ID	A code indicating the payment and transfer instructions and subsequent charge messages. The following formats are used: Snnn for entries related to payment and transfer instructions being sent through S.W.I.F.T., the last 3 characters are used to indicate the S.W.I.F.T. message type (number) Naaa for entries related to payment and transfer instructions, not sent through S.W.I.F.T. or where an alpha description is preferred, the last three characters are used to indicate: BOE Bill of exchange BRF Brokerage fee CHG Charges and other expenses CHK Cheques CLR Cash letter/cheques remittance COL Collections (used when entering a principal) COM Commission DCR Documentary credit (used when entering a principal) DIV Dividends - Warrants EQA Equivalent amounts ECK Eurocheques FEX Foreign Exchange INT Interest LBX Lock Box LDP Loan Deposit MSC Miscellaneous RTI Returned item SEC Securities STO Standing Orders TCK Travellers cheques TRF Transfer VDA Value date adjustment (used when an entry is made to withdraw an incorrectly dated entry it will be followed by the correct entry with the relevant code)
Transfer Minimum Amount	For standing orders of payment type "Above Maximum Balance" the amount defining the level above which the standing orders are deemed to be significant. If a transfer value is less than this amount the standing order will not be affected. For standing orders of payment type "Minimum Balance" this is the amount above which a transfer of funds will take place to maintain a minimum balance.

Field	Definition
Transfer or Transfer Type	On the Standing Orders Input (SOSTM) screen, for standing orders of type "Minimum Balance", this is the code that identifies which conditions govern the transfer. The codes and their meanings are: 1 The transfer is to be made only if the transfer amount exceeds that entered under "Transfer/Minimum Amount" 2 The transfer amount is that entered under "Transfer/Minimum Amount", irrespective of the actual amount required to make up the balance 3 The transfer amount must equal the actual amount required to make up the balance (entered as "Payment Amount") plus the value entered under "Transfer/Minimum Amount". On the Standing Orders Input (SOSTM) screen, for standing orders of payment type "Minimum Balance", this is the code that identifies which conditions govern the transfer. The codes and their meanings are: 1 The transfer is to be made only if the transfer amount exceeds that entered under "Transfer/Minimum Amount" 2 The transfer amount is that entered under "Transfer/Minimum Amount", irrespective of the actual amount required to make up the balance 3 The transfer amount must equal the actual amount required to make up the balance (entered as "Payment Amount") plus the value entered under "Transfer/Minimum Amount"
Type	On the General Ledger Account Summary Inquiry (GLASI), the General Ledger Account Definition Inquiry (GLADI) screen, this is the type of the General Ledger account. Values are: • Real (R) • Memo (M)
Updated Time	This is the time when the last update was carried out.
Value Balance	The total balance of an account, excluding all postings that have not come to value and cheques or drafts in clearing. The value balance is updated on each value date. Interest is calculated using this balance.
Value Balance as of	The total balance of an account, excluding all postings that have not come to value and cheques or drafts in clearing. The value balance is updated on each value date. Interest is calculated using this balance. This is as of the date shown.
Value Date	The date on which a transaction or event comes to value. This can be forward of the as-of date. The maximum number of days forward you may date a posting is determined at installation. For postings, if you do not enter a value date, the as-of date is used. For the GL Bulk Adjustments (GLADJ) screen. If you do not enter a value date for the first posting (on the first line), the as-of date is used. When you add further postings, the value date defaults to the entry on the previous line. For the Account History Inquiry (HISTA), the date for which the balances or accrual information shown apply.

Appendix A
Calculations

Introduction

This appendix gives the average balance calculation used by the General Ledger module.

General Ledger Average Balance

The overall average value balance of a general ledger account for a period to date is calculated using the following formula:

$$\frac{(A\ (B - C))\ +\ (D\ (E - B - 1))\ +\ F}{(E - C)}$$

where:

A Average value balance on prior balance record

B Number of days in the year up to and including the date of the last general ledger balance record

C Number of days in current year prior to the account opening date

D Balance on the prior value balance record

E Number of days in the year so far

F Current value balance
